Lexis: The main definitions of non-financial national accounts according with European System of Accounts (ESA 95) methodology	191

I. GENERAL INFORMATION

Currently, the European Union Member States use the National accounts system ESA 2010. Since September 2014, all EU Member States are required to publish data on national accounts according to the European System of Accounts 2010 (ESA 2010), which was approved by Regulation (EU) No. 549/2013 of the European Parliament and of the Council of 21 May 2013.

The transition to the new system of national accounts is considered to reflect the new economic realities and at the same time, satisfying the information needs of users in terms of the rapidity of publication of results and measurement of issues, such as current expenses resulting from research and development and the defense industry or liabilities related to pension schemes.

At the same time, the ESA 2010 is in line with the rules established for the System of National Accounts worldwide (SNA 2008), being adapted to the structure of the economies of the Member States so that the EU data are comparable with the compiled data by its main international partners.

The revised European System of Accounts includes a methodology and a transmission program which defines the accounts and tables to be provided by all Member States in accordance with the time limits. The revision regards the annual, quarterly and regional national accounts and government finance statistics.

ESA 2010 will gradually replace all other systems and textbooks, such as Balance of Payments Manual and Handbook of debt and deficit, as a frame of reference for standards, definitions, classifications and accounting rules for the compilation of national accounts by Member States, so as to obtain comparable results to support the objectives of the European Union.

Implementation of the 2010 SEC involved a retroactive revision of annual, quarterly and regional national accounts time series.

Methodological differences between ESA 2010 and ESA 95

ESA 2010 differs from ESA 95 both from the point of view of field of appliance as well as the concepts. Most differences correspond to those observed between the 1993 SNA and 2008 SNA.

The main differences are:

a) Research and development expenses recognized as capital formation

In ESA 95 payments for research and development services as well as to conduct research and development for own final consumption were treated as intermediate consumption for the units which utilized them.

ESA 2010 treats research and development, purchased or produced on own account, as gross capital formation and its depreciation as consumption of fixed capital.

According to ESA 2010, the impact of capitalization of research and development on national accounts is different in the case of a market producer and non-market one.

- i. In the case of a market producer, expenditure is reclassified from intermediate consumption to gross fixed capital formation. The effect is the increase of GDP and GNI by this amount.
- ii. In the case of a non-market producer (government owned) research and development expenses are already included in the value of production. Production, and thus GVA is increased only by the amount of fixed capital consumption estimated for it. The production value for research and development is reclassified from collective consumption of general government to gross fixed capital formation. The effect is the increase of GDP and GNI by the value of fixed capital consumption.

Data sources used for the capitalization of research and development are: Annual survey of enterprises, budget execution and balance of payments. Estimated consumption of fixed capital was based on the use of Continuous inventory method. Based on supply and use balances, intermediate consumption of market producers was reduced by the amounts of purchases of research and development and their allocation as gross fixed capital formation.

For research and development services produced by units classified as public administrations, the output, increased by consumption of fixed capital, was subtracted from the collective consumption of public administrations and allocated to fixed capital formation.

b) Non-life insurance (general) - production, disaster damage and reinsurance

Improvements to the methodology for estimating insurance activities were carried out in the Grant project "Improving the quality of national accounts" conducted in 2013-2014.

The project had the following objectives:

- solving specific problems signaled through reservations on insurance business;
- implement the recommendations of the ESA 2010.

Data sources used were the balance sheets of insurance corporations and annual reports of the Insurance Supervisory Commission. Changes regarding the method of calculating the production insurance are:

- according to ESA 95 production of general insurance was calculated as the difference between earned premiums and additional premiums on the one hand, and paid claims (unadjusted) on the other;
- according to ESA 2010 paid claims are adjusted by equalization reserve to prevent the occurrence of a negative output in the case of exceptionally high damage (in case of natural disasters, catastrophes, a.s.o.);

- according to ESA 95 the output of reinsurance was calculated as the difference between earned premiums and claims paid. According to ESA 2010, additional premiums (income from the investment of technical reserves) are added to earned premiums.

c) Expenditure for military equipment by general government recognized as capital formation

In ESA 95 only purchases of structures and military equipment who had a civilian equivalent were treated as gross fixed capital formation (airports, docks, roads, hospitals).

ESA 2010 extends the coverage of military capital goods by including military weapons and support systems even if they do not have a civil destination. This includes military vehicles, warships, submarines, military aircraft, tanks, etc. which are used for more than one year for defense services.

Consequently, GDP and GNI is increased by the amount of military equipment purchased rerouted from intermediate consumption to gross fixed capital formation, supplemented by the consumption of fixed capital value calculated for the equipment. Data sources used for assessing the military equipment costs were the budgetary executions and additional information provided by the Ministry of Defence.

d) Classification of units in general government and non-financial corporations

In ESA 95 reclassification of non-financial corporations sector companies in the General government sector was based exclusively on the 50% criteria (if less than 50% of the company's expenses are covered by their own income from the sale of its production). According to ESA 2010, in addition to the 50% criteria, qualitative criteria are considered:

- if the producer sells its output entirely, or over 50%, to general government, without entering into competition with private producers;
- if the producer does not take action to adapt its resources to achieve an adequate profit to operate under market conditions and to meet its financial obligations.

Impact on GDP and GNI is determined by the difference between its output, calculated as the sum of cost and its market output represented by its sales market. Data sources used for the application of quantitative criteria were profit and loss accounts of state owned companies. In order to apply qualitative criteria a questionnaire with specific questions was developed in collaboration with the Ministry of Finance, filled in by all units owned and controlled by the state. For the reclassified units the complete sequence of national accounts was compiled.

e) Small Tools

ESA 95 sets a threshold of 500 ECU, at 1995 prices, so that small tools (inventory items) would be recognized as gross fixed capital formation, otherwise they are treated as intermediate consumption.

ESA 2010 removes this threshold, the sole condition being that the small tools should be used in production for more than one year. Consequently, GDP and GNI will increase by the value of these small tools.

f) The third EU own resource based on VAT

In ESA 95, the third own resource based on VAT collected by the general government in the Member States and paid to EU institutions was registered as a tax on production and imports paid directly to the sector Rest of the world.

In ESA 2010, the third own resource based on VAT is recorded as transfer paid by the general government of the Member State to the EU institutions.

g) Central bank - the allocation of output

In ESA 95, the central bank output was allocated in full to the intermediate consumption of other financial intermediaries.

In ESA 2010, the share of output represented by commissions will be allocated to non-resident units (exports) and resident units for final consumption and GDP and GNI will increase accordingly.

h) Expenses for land improvements recognized as fixed capital formation

ESA 2010 introduces a new category of capital goods, land improvements (soil improvement works, flood prevention, reforestation, etc.) that is included in gross fixed capital formation, being removed from intermediate consumption.

As a result of these changes GDP and GNI increase accordingly.

II. GENERAL CHARACTERISTICS

1. Regrouping of institutional units into institutional sectors

The classification of units into institutional sectors is obtained by taking into consideration two representative characteristics for their economic behaviour, as follows: the category of producers the unit belongs to and the nature of their activities and main functions.

ESA provides information for the following institutional sectors:

- Non-financial corporations (S11);
- Financial corporations (S12);
- General government (S13);
- Households (S14);
- Non-profit institutions serving households (NPISHs) (S15);
- Rest of the world (S2).

2. The sequence of accounts of institutional sectors

ESA is built around a sequence of accounts inter-connected by balancing items.

The main non-financial accounts that are elaborated in the framework of national accounting according to the new methodology are the following:

- goods and services account (0);
- production account (I);
- primary distribution of income account (II.1);
 - generation of income account (II.1.1)
 - allocation of primary income account (II.1.2)
 - entrepreneurial income account (II.1.2.1)
 - allocation of other primary income account (II.1.2.2)
- secondary distribution of income account (II.2);
- redistribution of income in kind account (II.3);
- use of income account (II.4);
 - use of disposable income account (II.4.1)
 - use of adjusted disposable income account (II.4.2)
- capital account (III.1);
 - change in net worth due to saving and capital transfers account (III.1.1)
 - acquisitions of non-financial assets account (III.1.2)

In general, the accounts are balanced merely by using balancing items. The most significant balancing items are: value added, operating surplus/ mixed income, balance of primary income, disposable income, saving and lending/borrowing; they are expressed as gross value since there are not included estimates on fixed capital consumption.

3. Valuation of taxes, subsidies, social contributions and interests on basis of the accrual principle

Taxes, subsidies, social contributions and interests should be recorded at their value at the moment the activities or operations that give rise to the payment obligation take place that is on the basis of the accrual principle and not at the value of the actual paid amounts. In the framework of Romanian national accounts, the value of taxes, subsidies, social contributions and interests is recorded on the basis of the accrual principle by adjusting budgetary revenues. The adjustment is aimed at correcting the one-month gap between the moment when the transaction that generates taxes or contributions takes place and the moment of payment to the state budget.

4. Concepts of final consumption: final consumption expenditure and actual final consumption

It was necessary to introduce two concepts of final consumption in order to make the distinction between the expenditure made by a sector for the purchase of good and services with the aim of consumption (final consumption expenditure) and the value of goods and services consumed by the same sector (actual final consumption).

The difference between the two concepts stands in the way of approaching certain goods and services that are financed by the general government or by non-profit institutions serving households (NPISHs) and are delivered to households as social transfers in kind.

Final consumption expenditure (P.3) is made up of:

- the households final consumption expenditure;
- the general government final consumption expenditure, including both the expenditure for individual goods and services and collective expenditure;
- the final consumption expenditure of non-profit institutions serving households.

Individual consumption expenditure (P.31) covers goods and services (called “individual”) acquired by households to meet their members needs.

Collective consumption expenditure (P.32) covers services simultaneously supplied to all community members or to certain segments of it.

The whole final consumption expenditure of households is considered as intended for individual consumption. By convention, all goods and services supplied by non-profit institutions serving households are considered as individual.

The goods and services supplied by general government can be destined for collective consumption (expenditure for general government, national defence, public order, environment protection, research, etc.) or for individual consumption (expenditure on health, education, sport and entertainment activities, culture, collection of household waste).

5. The coverage of Gross Fixed Capital Formation (GFCF)

The coverage of gross fixed capital formation is extended to include in addition to acquisitions less disposals of tangible fixed assets, acquisitions less disposals of intangible fixed assets namely mineral exploration, software and databases, recreational works, literary or artistic originals.

6. FOB valuation of imports and exports of goods and services

Imports and exports of goods and services should be evaluated at FOB prices (free on board), meaning that a CIF-FOB correction is made on CIF prices (cost, insurance, freight) of imports.

The CIF price is the price of a good at the border of importing country or the price of a service delivered to a resident before the payment of any import duties or other taxes on imports or trade and transport margins within the country.

The FOB price comprises:

- the value of goods at basic prices;
- the value of transport and distribution services up to the frontier, including costs of loading on board of a transport mean;
- taxes minus subsidies on exported goods.

7. Allocation and re-allocation of Financial Intermediation Services Indirectly Measured (FISIM)

Financial Intermediation Services Indirectly Measured (FISIM) are divided between intermediate consumption, final consumption and exports. FISIM related to intermediate consumption are in their turn allocated by institutional sectors and activity branches.

Estimations for the allocation of FISIM by institutional sector and industry are performed based on the results obtained in the survey conducted within the units belonging to the financial-banking sector.

8. Improving the coverage of national accounts including non-observed economy

It refers to estimation and inclusion in national accounts of all the activities (legal or illegal) that are carried out within the economy. A special attention is given to the estimation of hidden economy. The hidden (non-observed) economy could be estimated using a specially developed methodology, specific to each country. In Romania the hidden economy covers the legal but statistically non-registered activities for the following institutional sectors:

- non-financial corporations, by including the estimation of black labour and VAT evasion;
- households, by including the estimations concerning the family associations and self employed, fiscally non-registered activities such as teaching private lessons, accommodation, construction, as well as tips received for certain services: construction, trade, hotels and restaurants, transports, communication, health etc.

9. Delimiting Mixed income within generation of income account

In the case of unincorporated enterprises, family associations and self-employed in the households sector, the balancing item of the generation of income account implicitly contains an element corresponding to remuneration for work carried out by the owner or his family members which cannot be distinguished from his profits as entrepreneur. This item called "mixed income" is separately identified starting with the estimates for 2010.

10. Classifications used

The compilation of national accounts by industries is made on the basis of **the national system of general interest economic classification**, particularly the classification of national economy activities and the classification of products and services associated to activities, in force at the time.

Starting 1st January 2008 **the Classification of national economy activities Rev.2 (NACE Rev.2)** and **the Classification of products and services associated to activities, version 2008 (CPA 2008)** were implemented in Romania.

They have been used for the compilation of national accounts starting year 2008. In order to make coherent the time series of national accounts by industries, the historical series were revised according to new classifications.

The present publication contains the national accounts for 2012-2013 elaborated according to NACE Rev.2 and CPA 2008 classifications.

III. NON-FINANCIAL NATIONAL ACCOUNTS FOR THE YEARS 2012-2013

The gross domestic product obtained in 2013 amounted to 637456.0 millions lei, increasing by 3.5% compared to the previous year. The gross domestic product per capita grew by 3.9% reaching 31895.4 lei per capita in 2013.

The structure of gross domestic product by categories of resources in 2013 had the following characteristics:

- services registered, as in previous years, the most important contribution to the formation of GDP (321500.7 millions lei, accounting for 50,4% of the total);
- the second place was taken by the industry (160605.6 millions lei, respectively 25.2% of the total);
- the contribution of agriculture, forestry and fishing was nearly a quarter share of industry, namely 34402.8 millions lei, representing 5.4 % of GDP;
- the construction sector had a 7.0% contribution to GDP formation.

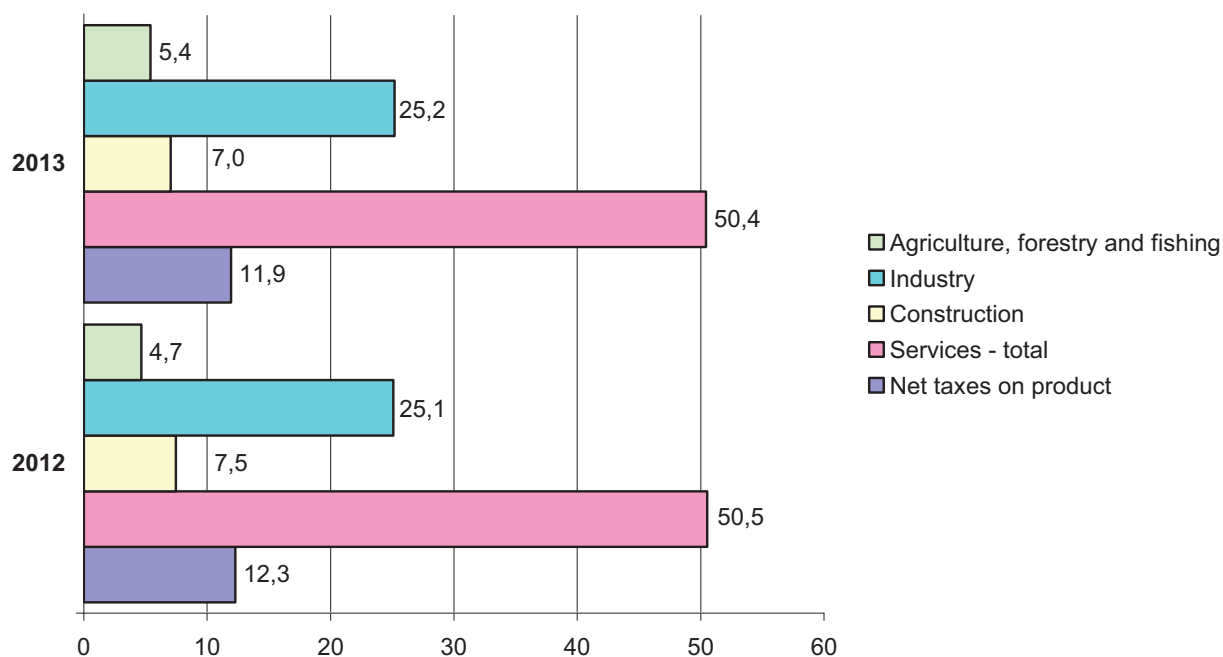

Table 1: Gross domestic product by resources

	Millions of lei current prices		Structure (%)	
	2012	2013	2012	2013
GROSS DOMESTIC PRODUCT	595367,3	637456,0	100,0	100,0
Agriculture, forestry and fishing	27788,8	34402,8	4,7	5,4
Industry	149324,6	160605,6	25,1	25,2
Construction	44437,3	44894,5	7,5	7,0
Services - total	300745,4	321500,7	50,5	50,4
Gross Value Added (GVA) - total	522296,1	561403,6	87,7	88,1
Net taxes on product	73071,2	76052,4	12,3	11,9

Analyzing GDP structure by main resources during 2012 – 2013 one can see that the high share of services and industry in total GDP was maintained, the share of construction decreased while the share of agriculture increased.

As noted in the table above, construction sector recorded an decrease of 0.5% over the previous year; all the components bringing their contribution to this evolution – residential, non-residential and infrastructure.

A significant contribution to GDP growth came from the services sector, while industry and agriculture experienced a mild increase.

Graph 1: Structure of gross domestic product by categories of resources - %

The share of total gross value added (GVA) in gross domestic product was 88.1% in 2013 experiencing a slight increase compared to 2012.

The annual variation of GDP and GVA, respectively, by categories of resources, during 2012 - 2013, is presented in the table below:

Table 2: The annual variation of gross domestic product by categories of resources

	% as against previous year	
	2012	2013
GROSS DOMESTIC PRODUCT	0,6	3,5
Gross Value Added	0,4	4,1
- in agriculture ¹⁾	-26,1	33,7
- in industry ²⁾	-7,0	3,8
- in construction	-1,1	4,4
- in services	9,2	1,5

1) Including forestry and fishery

2) Including electric and thermal energy, gas and water.

The gross domestic product calculated by expenditure approach is the sum of actual final consumption expenditure, gross capital formation and net exports of goods and services.

Table 3: Gross domestic product by categories of uses

	Millions of lei current prices		Structure (%)	
	2012	2013	2012	2013
GROSS DOMESTIC PRODUCT	595367,3	637456,0	100,0	100,0
Actual final consumption	465156,9	479450,6	78,1	75,2
- Actual individual final consumption of households	427700,2	430463,8	71,8	67,5
- Actual collective final consumption of general government	37456,7	48986,8	6,3	7,7
Gross fixed capital formation	162771,9	157482,6	27,3	24,7
Change in stocks	-2950,9	5467,8	-0,5	0,9
Net exports of goods and services	-29610,6	-4945,0	-5,0	-0,8
- Exports of goods and services	223048,9	253377,4	37,5	39,7
- Imports of goods and services	252659,5	258322,4	42,4	40,5

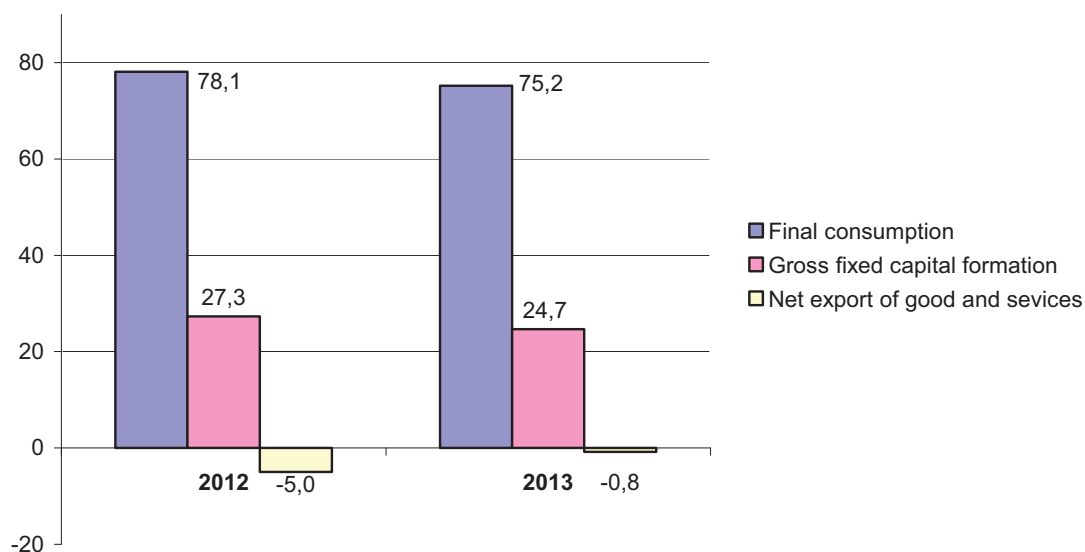

In 2013 actual final consumption amounted to 479450.6 millions lei; which accounted for 75.2% of GDP and represented a decrease of 2.9 % compared to the level of the previous year.

The actual individual final consumption of households, the most important component of actual final consumption was 430463.8 millions lei that is 67.5% of GDP, decreasing by 4.3% as against 2012.

As for the actual final collective consumption of general government, it reached 48986.8 millions lei in 2013 accounting for 7.7% of GDP, this component experienced an increase of 1.4% compared to the previous year.

Gross fixed capital formation (GFCF) amounted to 157482.6 millions lei accounting for 24.7% of GDP in 2013, and experienced a decrease of 2.6% compared to 2012.

Graph 2: Gross domestic product by categories of uses - %

Total export of goods and services was 253377.4 millions lei accounting for 39.7% of GDP showing an increase of 2.2% as against 2012.

Total import of goods and services was 258322.4 millions lei accounting for 40.5% of GDP, and experienced a decrease by 1.9 % as against 2012.

During the analysed period, imports of goods and services exceeded exports and this fact is highlighted by the balance of trade respectively net exports of goods and services; discrepancy import – export was 1 to 0.98 that is for each 1 leu for imports of goods and services, the export was less by 2%.

The coverage rate of imports by exports experienced an increase (by 9.8%) from 88.3% in 2012 to 98,1% in 2013.

Significant changes in the coverage rate were registered in the following sectors: wholesale and retail trade, repair of motor vehicles and motorcycles; water supply and sanitation; electricity, gas, steam and air-conditioning supply; human health activities; IT services; consulting services and related services; information services; advertising and market research; other professional, scientific and technical services; veterinary services.

The analysis of efficiency in Romanian export operations is also reflected by the penetration rate of imports on the domestic market, which is calculated as a percentage ratio of import value in the domestic market.

Significant increases can be observed for: electrical equipment; manufacture of machinery and equipment n.e.c. computers, electronic and optical products, basic pharmaceutical products and pharmaceutical preparations and manufacture of chemicals and chemical products.

Table 4: The annual variation of gross domestic product by categories of uses

	% as against previous year	
	2012	2013
Gross domestic product	0,6	3,5
Total final consumption	1,1	-0,3
of which:		
- Actual final consumption of households	1,7	-2,4
Gross fixed capital formation	0,1	-5,4

The Gross Domestic Product (GDP) calculated by income approach is the sum of value added elements (namely: compensation of employees, gross operating surplus, mixed income, net taxes on products) and other taxes minus subsidies on production.

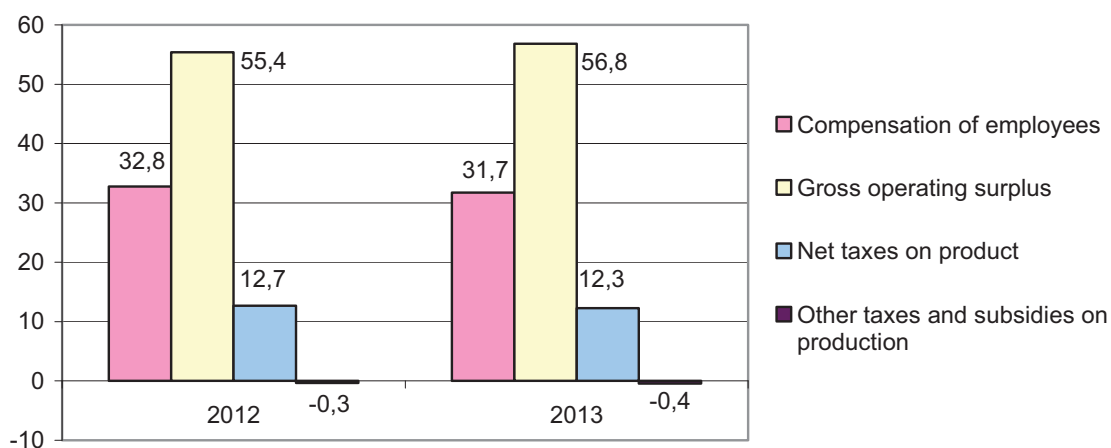

Table 5: Gross domestic product by income method

	Millions of lei current prices		Structure (%)	
	2012	2013	2012	2013
GROSS DOMESTIC PRODUCT	595367,3	637456,0	100,0	100,0
Compensation of employees	195223,4	202314,4	32,8	31,7
of which:				
Gross salaries and allowances	161624,9	166375,5	27,1	26,1
Other taxes on production	3460,2	3651,6	0,6	0,6
Other subsidies on production	-6103,3	-6891,1	-0,9	-1,0
Gross operating surplus including mixed income	329715,8	362328,7	55,4	56,8
Gross Value Added (GVA)	522296,1	561403,6	87,7	88,1
Net taxes on products	75570,5	78135,8	12,7	12,3

Analyzing the structure of the gross domestic product calculated by income approach, one can observe the following characteristics:

- compensation of employees contributed with 31.7% in GDP; in 2013 this component experienced a decrease by 1.1% as against 2012;
- gross operating surplus (GOS), including mixed income, accounted for 56.8% of GDP.

Graph 3: The structure of gross domestic product by income approach - %

This chapter presents the main elements of the macroeconomic balance between resources and uses of goods and services, preceding the detailed description of demand and supply various components.

All transactions with goods and services are set out in the framework of the input-output table that presents the balance between resources and uses by product:

Output + Imports of goods and services + Trade and transport margins + CIF-FOB correction + Taxes on products - Subsidies on products = Intermediate consumption + Total final consumption + Gross fixed capital formation + Change in inventories + Exports of goods and services

as well as the production accounts by industries:

Gross value added = Output - Intermediate consumption.

Gross Domestic Product (GDP) is defined as the sum of all resources that ensure the final balance of uses of goods and services, except imports. Thus, for the total economy we have:

GDP + Imports of goods and services = Total final consumption + Gross fixed capital formation + Change in inventories + Exports of goods and services

Connecting this definition to the previous identities we obtain:

GDP = Sum of Gross values added of industries + Taxes on products - Subsidies on products.

The output is evaluated at basic prices (without invoiced VAT and other taxes on products but including the subsidies on

products), imports at FOB prices by adding the CIF-FOB correction, intermediate consumption and final uses at purchase prices and exports at FOB prices.

The decomposition into volume and price components is the one in which the volume is measured using the prices of the previous year.

The change "in volume" of gross domestic product is considered to be a synthetic indicator of the changes occurred in the national economy activity, measured on the basis of the previous year prices. By comparing the change in volume with that in value of the gross domestic product it is possible to calculate the implicit change of the GDP price representing an aggregation of all changes in prices used for compiling the input-output table. Therefore, the implicit price index of GDP can be considered as an indicator of the general evolution of prices in economy.

The contributions to the volume change of GDP are calculated based on the formula that defines GDP as a sum of all final uses of goods and services, except imports of goods and services. The contribution of any component of final uses to the volume change of GDP is defined as a percentage ratio between the change in volume of this component between year "n-1" and year "n" and the value of GDP in year "n-1". Through this type of calculation the sum of the contributions of different components is equal with the growth rate of GDP between year "n" and year "n-1".

1) For 2012 and 2013 we used the resident population on July 1, estimated in terms of comparability with the final results of the Population and Housing Census - 2011.

2) Active population was recalculated according to the resident population against the criteria of habitual residence under comparability with the results of Population and Housing Census - 2011

3) Revised data.

Note: Data from the institutional sector accounts were not reconciled with data from input-output tables.

The objective of this chapter is the accounting and economic description of production, as a whole and by industries. The aggregates of the generation of income account by industries are also presented: compensation of employees, gross operating surplus. All aggregates are detailed by industries, as the most detailed item used for the production analysis. The industry groups together all units engaged in a homogeneous activity. The industrial classification is based on the Classification of Activities in National Economy (NACE, rev. 2).

The main aggregates are:

- a) Production of goods and services
- b) Gross value added
- c) Gross operating surplus
- a) Production comprises all the goods and services achieved during an accounting period, usually a calendar year.

Three types of output can be distinguished:

- market production of goods and services, that is output sold at prices that are economically significant or otherwise disposed of on the market, or intended for sale or disposal on the market. By convention, and according to national accounts rules, all the goods are considered to be sold or disposal on the market. The output of market services covers all services which are produced by units for which over 50 per cent of costs are covered by revenue from sales of their own output;
- output for own final use consists of goods and services that are retained for their own final consumption by the owners of the enterprises in which they are produced. As corporations have no final consumption, output for own final consumption is produced only by unincorporated enterprises: for example, agricultural goods produced and consumed by members of the same household. Goods or services used for

own gross fixed capital formation can be produced by any kind of enterprise. They include, for example, machine-tools or construction produced for their own use by enterprises, dwellings or extensions to dwellings produced by households;

- other non-market output consists of goods and individual or collective services produced by general government and NPISHs that are supplied free, or at prices that are not economically significant, to other institutional units or the community as a whole.
- b) Gross value added is the balancing item of the production account and is defined as the value of outputs less the value of intermediate consumption; it is therefore the value newly created within the production process.
- c) Gross operating surplus is the balancing item of the generation of income account showing what remains of the value added after deducting the compensation of employees and taxes less subsidies on production. The way of calculating the gross operating surplus is the following:
 - Gross value added
 - + Other subsidies on production
 - Other taxes on production
 - Compensation of employees
 - = Gross operating surplus
- d) Mixed income is defined as the accumulated surplus or deficit production by individual enterprises in the household sector. Implicitly contains an element of remuneration for work done by the owner, or other members of the household, who can not be identified separately from the owner's income as an entrepreneur, but excludes the operating surplus coming from owner-occupied dwellings.

Generally Mixed income is presented with gross operating surplus.

Using the indicators of the production and generation of income accounts, the gross domestic product (GDP) – the main macroeconomic aggregate – can be derived by the following approaches:

Production approach

$$\text{GDP} = \text{GVA} + \text{TP} - \text{SP}$$

Where:

GDP= Gross domestic product (market price)

GVA= Gross value added (basic price)

TP = Taxes on products

SP = Subsidies on products

Income approach

$$\text{GDP} = \text{CE} + \text{GOS} + \text{OTP} - \text{OSP}$$

Where:

CE = Compensation of employees

GOS = Gross operating surplus

OTP = Other taxes on production

OSP = Other subsidies on production

The main data sources used for the compilation of production and generation of income accounts are:

a) Statistical data sources:

- the Structural Business Survey;
- the Households Labor Force Survey;
- the Households Budget Survey;

- the balance of agricultural products.

b) Accounting and financial data sources:

- the annual accounting statements of financial institutions;
- the annual accounting statements of non-financial enterprises;

c) Administrative data sources:

- information from the execution of the consolidated general government budget;
- the outcomes and expenses of public institutions, partially or totally financed by extra-budgetary funds;
- the balance of payments from the Romanian National Bank;
- the income declarations made to the Ministry of Finance by the self-employed and family associations.

The Structural Business Survey is the main data source used to produce national accounts and to spotlight the specific indicators for each sector providing a complete picture of the national economy structure by industry, type of ownership and regions.

The Households Labor Force Survey provides essential data on the activity of different population groups.

The Households Budget Survey is a regular survey conducted to obtain information for describing the population incomes and expenditures and their evolution over time.

This chapter presents the evolution of the domestic demand main components: total final consumption, final consumption expenditure of households, gross fixed capital formation, and change in inventories.

1. Total final consumption

According to ESA, two concepts of final consumption can be distinguished:

- final consumption expenditure;
- actual final consumption.

Final consumption expenditure refers to expenditures made by a sector in order to purchase goods and services with the aim of consumption. Actual final consumption refers to all purchased goods and services actually consumed by a sector. The difference between the two concepts is the treating way of certain goods and services that are financed by the general government or by the non-profit institutions serving households (NPISHs) that are delivered to households as social transfers in kind.

1.1 Final consumption expenditure of households

Final consumption expenditure of households, as defined by the national accounts, consists of expenditures on all goods and services incurred by households to satisfy their individual needs. It covers all market goods and services as well as the households' consumption of own-account production of agricultural and non-agricultural products (produced within the households) and services (housing services of owner-occupied dwellings).

Final consumption expenditure of households does not include the purchases of sole proprietors or family associations used for productive activities, these being treated as intermediate consumption.

The national final consumption represents the consumption of resident households no matter if it takes place on the economic territory or in the rest of the world. The balance between the final consumption of residents in the rest of the world and the

final consumption of non-residents on the economic territory cannot be distributed by products being globally affected to an item called "territorial correction".

Final consumption expenditure of households includes all purchases of durable goods except dwellings and equipment acquired by sole proprietors and family associations. The expenses for current maintenance of dwellings are included in the final consumption while the major renovations of dwellings are included in the gross fixed capital formation.

Final consumption expenditure of households is valued at purchasers' prices for the market goods and services and at producers' prices for those self-consumed.

2. Gross fixed capital formation

Gross fixed capital formation (GFCF) consists of resident producers' acquisitions, less disposals of fixed assets in a given period plus certain additions to the value of non-produced assets stemming from the productive activity of producers or institutional units. Fixed assets are produced assets used in production for more than a year.

GFCF includes:

- housing,
- other buildings and structures, these include major improvements of the land;
- machinery and equipment;
- weapons systems;
- cultivated biological resources, eg trees and livestock;
- cost of ownership transferred of non-produced assets such as land, contracts, leases and licenses;
- research and development (R & D), including the production of freely available R & D;
- exploration and mining evaluations,
- computer software and databases;

- entertainment, literary and artistic
- other intellectual property rights.

The acquisitions of land and intangible assets are excluded from the GFCF, being recorded in the uses of the capital account of institutional sectors.

GFCF does not include the value of market research or advertising activities which are recorded as intermediate consumption.

Purchased goods and services included in GFCF are valued at purchasers' prices excluding deductible VAT; own-account production for own fixed capital formation is valued at production costs.

GFCF is estimated:

- by institutional sectors; GFCF by institutional sector is calculated as the difference between purchases and sales of existing capital goods. All institutional sectors reveal in their accounts GFCF. The "Households" sector applies GFCF only to purchases of dwellings;
- by product; GFCF by product and for the economy as a whole refers to acquisition of new fixed assets only.

3. Change in inventories

Inventories represent all goods stored by resident units for future use, further processing or sale.

Inventories are classified into:

- users' inventories, covering raw materials and other supplies, breeding

stock, young animals being fattened, equipment for investments etc., which are stored by the user in order to be used for production;

- producers' inventories, covering finished goods and work-in-progress stored by producers;
- trade inventories, covering goods for re-sale stored by commercial agents.

Change in inventories is estimated as a difference between the closing and opening stock values.

In business accounting opening and closing stock values are recorded at their historic cost and that is not in line with the national accounts methodology which recommends that goods withdrawn from inventories should be valued at the prices prevailing at the time the goods are withdrawn rather than at the prices at which they entered inventories.

Therefore, and also as a consequence of the high inflation, the change in inventories based on the business accounting is overestimated including significant holding gains.

According to the national accounts methodology these should be eliminated. Therefore, the change in inventories of the national accounts, called "economic change in inventories", is not equal to the change in inventories of the business accounting, also called "accounting change in inventories", the difference representing holding gains.

This chapter contains the main information concerning the exchange of goods and services between the Romanian economy and the rest of the world.

1. Imports and exports of goods

The imports and the exports of goods are calculated based on the custom statistics. For the products that are not covered by custom statistics, statistical reports are drawn up. For goods transported by cable or pipes, as natural gas and electricity, the change of ownership principle is used.

The imports and exports of goods are valued at FOB prices.

The imports / exports of goods include:

- sales/purchases of goods by resident units to/from non-resident units;
- barter trade;
- goods received or given as international aid;
- goods provided in Romanian ports and airports to non-resident carriers and those provided in foreign ports and airports to Romanian carriers;
- non-monetary gold;
- goods imported in order to be processed and re-exported.

According to ESA 2010, goods sent abroad for processing are not considered exports, when leaving the country or imported when you come back, because there is no change of ownership. For national accounts physical movement of goods is not important, what matters is only the change of ownership.

Processing fee in intermediate consumption for the owner of the goods. In the country where processing takes place, the goods are not considered imports when entering the country or exports when leaving the country, the processing fee is export of services. In Input-Output Table the imports of goods are valued at CIF prices for all groups of products.

The transition from CIF to FOB valuation of the total value of imported products is made by inserting an adjustment line and column within the resources and uses framework.

2. Imports and exports of services

The data concerning the imports and the exports of services are obtained from the special surveys undertaken by the National Bank of Romania in order to compile the Balance of Payments.

The external exchange of services between the resident and non-resident units covers:

- services for processing goods
- maintenance and repair services;
- transport services;
- tourism services;
- construction services;
- insurance and pension funds;
- financial services;
- fees for the use of intellectual property;
- telecommunications services, computer and information;
- business services;
- personal, cultural and recreational services;
- services for government such as local expenses by foreign embassies;

3. Competitiveness indicators

The export effort calculated as a percentage ratio between the value of exports and domestic output.

The covering rate of imports by exports is calculated as a percentage ratio between the value of exports and imports.

The penetration rate of foreign products on the domestic market is calculated as a percentage ratio between the value of imports and domestic markets (output + imports - exports).

1. Categories of prices used by the national accounting

The flows recorded by the national accounting represent economic transactions measured in terms of money. The value of a transaction can be directly factored into two components: number of quantitative units and the price at which each of these elementary quantitative units is exchanged. For an elementary product this can be expressed by the following equation “value = quantity x price” and by its correspondent in terms of evolution “value index = volume index x price index”.

In different positions of the national accounts are generally found transactions involving more than one elementary product. The measurement of the change in volume and price leads to the necessity of aggregation of the individual indices corresponding to elementary products. The aggregated volume index is a Laspeyres type index. The aggregation of individual indices is done by weighting with the base period values. The aggregated price index is a Paasche type index calculated by aggregating the individual price indices using as weights the values of the current period.

1.1 Prices of the gross value added

Once of price indices for output and intermediate consumption for market goods and services are available, price indices for different components of production account of industries with market production could be calculated. In particular, one can calculate gross value added in constant

prices as a difference between goods and services output in constant prices and intermediate consumption in constant prices. This estimation method is called “double deflation” due to the fact that value added in the prices of the base period is not directly evaluated by using a specific price index, but by separate deflation of the elements whose balancing item is.

2. The system of price indices used in the Romanian national accounts

For the constant price valuation of the main aggregates of the national accounts, the prices of the previous year are used. This is done within the framework of the input-output table in constant prices.

In order to deflate the aggregates of the national accounts several price indices series are used:

- Consumer price indices;
- Producer price indices;
- Indices of prices on the farmers’ market;
- Price indices of agricultural production;
- Price index of construction;
- Unit value indices of imports and exports of goods;
- Price indices derived within the framework of the balance of resources and uses by products and used to deflate intermediate consumption, gross fixed capital formation, change in inventories, trade margins, taxes and subsidies on product.

The European Commission Regulation on the **ESA 2010 Transmission Programme** requires Member States to disseminate the annual and quarterly data on employment, compiled according to national accounts concepts.

Disseminated data refers to employment (employees and self-employed) according to the classification of national economic activities (NACE Rev. 2). The units of measure are “thousands persons” and “thousands hours worked”.

Employment covers all persons – both employees and self-employed – engaged in some productive activity that falls within the production boundary from national accounts.

Employees are defined as all persons who principally work, based on a formal or informal agreement, for a resident institutional unit in exchange for a salary or remuneration equivalent.

Self-employed persons are defined as persons who are the sole owners, or joint owners, of the unincorporated enterprises without legal personality, in which they work. In this category are included: unpaid family workers, including those working in unincorporated enterprises engaged in market production, outworkers whose income is a function of the value of the outputs from some process of production for which they are responsible and workers engaged in production undertaken entirely for their own final consumption or own capital formation, either individually or collectively.

In order to compare the outcome of the units’ productive activities with the employment, one should take into account the resident and non-resident persons

employed by the resident productive units – the so-call **domestic concept**.

In this sense, the base data are adjusted as following:

- nationals who are on the staff of diplomatic missions abroad are added;
- non-resident workers employed less than one year into activities in the Romanian economic territory are added;
- resident workers who work in another economic territory are subtracted.

According to ESA, there are taken into compilation both principal and secondary activities of employed persons, based on **hours actually worked**.

The main **data sources** used to estimate employment are the following:

- Households labour force survey (AMIGO);
- Survey on the labour cost (S3);
- Structural business survey (ASA);
- Administrative data sources (information from Ministry of External Affairs, Ministry of Labour, Family Social Protection and Elderly People, Ministry of Internal Affairs, etc.);
- Financial statements of financial corporations.

Tables on employment which are included within the present chapter are similar to the ones transmitted according to the Regulation, being presented both annual and quarterly estimates for 2012 and 2013.

**06.01 EMPLOYMENT, BY PROFESSIONAL STATUS AND
BY ACTIVITIES OF NATIONAL ECONOMY**

The non-financial accounts balancing items of institutional sectors

This chapter presents the main aggregates, respectively the incomes created (value added and operating surplus) in the national economy, the incomes preserved or acquired by residents (disposable incomes) and those being saved. These savings are mostly used for investments (GFCF, change in inventories and net purchases of land and intangible assets). For the national economy as a whole the difference between savings and investments (GCF), except capital transfers, if it is negative is financed by the rest of the world and, in this case, we

record a net borrowing of the nation; in the case of a positive difference, this is used to finance the rest of the world and we record a net lending. It is also to be noticed that, for each institutional sector, the net lending (net borrowing, respectively) allows net financing (net investments) of these sectors.

GCF is not enough to appreciate the investment effort: gross fixed capital formation should be compared to the capital consumption to allow the evaluation of the capital net growth.

Gross domestic product	100.0	100.0

Note: Data for 2012 from the institutional sector accounts were not reconciled with data from input-output tables

1. Definition

Non-financial corporations sector (S.11) includes all institutional units with legal status and whose main activity is the production of non-financial market goods and services.

2. Institutional sectors accounts

Table 08.01 describes in detail the sequence of accounts and their balancing items: production account (of which gross value added is pointed out), generation of income account (whose balancing item is the gross operating surplus (GOS)), the primary distribution of income account (resulting the gross balancing item of primary income which, for non-financial enterprises, is gross national income), the secondary distribution of income account of which balancing item is gross disposable income, the redistribution of income in kind account (the resulting balancing item being gross adjusted disposable income), the use of disposable income account from which results, as balancing item, the gross saving, the non-financial assets account (which

leads to the calculation of net lending (+) or borrowing(-).

3. Specific ratios

These accounts allow the calculation of the ratios emphasising the destination of the gross value added and its evolution during the last years.

The investment ratio corresponds to the ratio between the gross fixed capital formation (GFCF) and gross value added. It is to be noticed that GFCF does not include net purchases of land and intangible assets that are separately recorded.

Two self-financing ratios are calculated:

- "in restricted sense" as a ratio between gross saving and GFCF;
- "in extended sense" which has in addition to the nominator the balance of investment grants (D.92) and other capital transfers (D.99) and to the denominator acquisitions less disposal of non-produced non-financial assets (**NP**).

The households sector (S14) covers individuals or groups of individuals as consumers and possibly also as entrepreneurs producing market goods and market non-financial and financial services provided that, in the latter case, the corresponding activities are not those of separate entities treated as quasi-corporations.

1. The formation of gross disposable income (table 09.02)

The constitution of gross disposable income is accomplished in two steps: the distribution of the gross primary income and the net redistribution transfers.

The primary income comprises the incomes from activity directly linked to production factors and the property incomes.

The incomes from activity are incomes from work received by the employees, on one hand, and gross operating surplus, on the other hand.

Gross operation surplus of households, except for that of the sole proprietors, corresponds to the incomes derived from dwelling services (actual and imputed rents of owner-occupied dwellings) and from domestic households' industrial production.

Are recorded as property incomes:

- the total incomes obtained as interests (actual interests – D41);
- rents (D45);
- distributed income of corporations (D42);
- dividends (D421) and withdrawals from income of quasi-corporations (D422).

These incomes are not linked to carrying out a production activity by a member of the household, but they have the characteristics of a primary distribution.

The net redistribution transfers comprise the following items:

- current taxes on income and wealth (D5);
- actual social contributions (D611) and imputed social contributions (D612);
- social benefits, other than social transfers in kind (received) (D62);
- other current transfers (D7).

These include:

- net non-life insurance premiums (D71);
- non-life insurance claims (D72);
- miscellaneous current transfers (D75).

The uses of the gross disposable income of households are actual final consumption and gross saving.

The ratio between gross saving and gross disposable income is called saving ratio.

The gross saving, increased by the capital transfers received, is used for capital transactions (non-financial accumulation):

- gross capital formation (GFCF);
- change in inventories;
- acquisitions less disposals of non-produced non-financial assets;
- acquisitions less disposals of land and other tangible non-produced assets.

The balancing item is the net lending (+) or borrowing (-) of households, used for financial accumulation (financial account).

The ratio between the net lending (+) or borrowing (-) gross disposable income is called financial saving ratio.

2. Evolution and formation of wages and salaries (table 09.05)

The compensation of employees (D1), which represents the primary income includes:

- gross wages and salaries (D11);
- employers' social contributions (D12).

It corresponds, from the point of view of labour cost, to the total expenditure made by the employer in direct counterpart with the use (the employment).

The evolution of gross wages and salaries (D11) paid to households by resident institutional sectors is presented in table 09.05 that emphasises the share paid by non-financial corporations and by general government.

Gross wages and salaries received by households are calculated by adding to the upper values the balancing item of wages transfers with the rest of the world.

The passage to the net wages, which represent the actual amount received by households, is accomplished by deducting from gross wages actual social contributions of households (D.613) and income tax (D51).

I. General government

1.1 Coverage of the General government sector

The General government sector (S13) comprises all the institutional units, which are non-market producers and their output is for individual and collective consumption. Resources came from compulsory contributions paid by units belonging to other sector or/and all institutional units whose main activity is the redistribution of income and national wealth.

The General government sector is regrouped into three sub-sectors:

- Central government (S.1311) which includes the state budget, special (additional) funds, special treasury funds, public institutions partially or totally financed from extra-budgetary funds subordinated to ministries and other public or private institutions mostly financed by government subsidies;
- Local government (S.1313) with a limited geographical authority; this sub-sector includes local budgets, public institutions totally or partially financed from extra-budgetary funds subordinated to local councils and the municipality of Bucharest, other public or private institutions mostly financed by local budget subsidies;
- Social Security government (S.1314) includes all central and local institutional units whose main activity is social contributions (i.e. Social Security Fund)

1.2. The correspondence between taxes recorded in public accounting and taxes specific to national accounting

Table 10.02.A, B presents on row the three institutional sub-sectors which benefits of these incomes and on columns the taxes specific to national accounting, i.e. compulsory payments received or not

by the public administrations, excluding social contributions.

The compulsory payments include the following taxes: taxes on products (VAT, taxes and duties on imports except VAT, other taxes on product; current taxes on income and wealth (tax on profit, other current taxes)).

1.3. Passage from budgetary balance to net lending /net borrowing of the General government (tables 10.03 A, B)

The budgetary balance from the Finance Law is broken-down into a balance of final transactions (State budget) and a balance of temporarily transaction (special funds accounts- additional).

The flows between the state and other agents can be also described in treasury transaction (not budgetary).

So, three government sub-sectors can be set up: state budget, treasury special funds, and special funds budget (additional).

Net lending of each sub-sector described above can be calculated as follows: from the state budget balance, treasury accounts balance, special (additional) funds accounts balance recorded by the business accounting one subtract the balance of the financial transactions recorded by these (i.e. reimbursement of funds, payments or receipts of instalments, external credits, etc.) and all these are correcting the balances of the business accounting calculating finally the net borrowing or lending of the nation.

1.4. Simplified accounts

The accounts presented refer to Local government, General government and Social security. These simplified accounts exclude the intermediate balances and imputed flows (imputed contributions and benefits, final consumption, non-market output).

2. Non-profit institutions serving households (NPISHs)

Non-profit institutions serving household's sector (S15) groups units with legal status, which serve to the households and they, are other non-market private producers. Their main resources, other than incidental

sales, mostly result from voluntary contributions in cash or in kind of households, as consumers, from general government receipts and from property incomes.

This sector includes political parties, religious cults, trade unions, non-profit associations and foundations.

1) Swaps are contractual arrangements between two parties who agree to exchange, over time and according to predetermined rules, streams of payment on the same amount of indebtedness.

2) FRAs* are contractual arrangements in which two parties, in order to protect themselves against interest rate changes, agree on an interest rate to be paid, at a specified settlement date, on a notional amount of principal that is never exchanged.

(* = forward cote agreements)

3) Excessive Debit Procedure

Financial Corporations sector (S12) includes all corporations and quasi-corporations, which are principally engaged in financial intermediation and/or auxiliary financial activities.

This sector includes the following categories of units:

- National Bank;
- Romanian and foreign Commercial Banks;
- Savings Bank;
- Mutual insurance fund;
- Brokerage corporations;
- Financial investment corporations;
- Stock Exchange;
- Exchange offices;
- Credit co-operatives;
- Insurance corporations;
- Guarantee Fund of the Deposits Banking;

- Private Fund by pensions.

The output of financial corporations sector includes:

- the output of banking services, other than the imputed output of banking services; this output comprises commissions, fees and banking expenses, incomes from other activities;
- financial intermediation services indirectly measured (FISIM) are measured, conventionally by the balancing item between received interests and paid interests of credit institutions as a result of their financial intermediation activity.
- the direct insurance output is calculated as a difference between the actual premiums earned and claims due for payment, at which the incomes from investment of the insurance technical reserves are added;

Note: Data for 2012 from the institutional sector accounts were not reconciled with data from input-output tables

This chapter presents the accounts of the relationships with the rest of the world, emphasising the transactions between the resident and non-resident units.

Starting September 2014 came into effect the new system of national accounts called ESA 2010.

Methodological differences between ESA 95 and ESA 2010 for the rest of the world are:

In ESA 95, VAT- third-based own resource is collected by Member States government and transferred to the European Union institutions was recorded as direct taxes on production and imports paid to the rest of the world.

In ESA 2010, VAT third-based own resource is recorded as current transfer paid by the General Government of each Member State to the EU institutions.

Contributions to the EU institutions is recorded as (D.76) "EU own resources based on VAT and GNI".

The new approach has no impact on GDP, but the transition from GDP to GNI amount of taxes on production and imports (D.2) paid to the rest of the world will decrease. Consequently, GNI will increase by VAT-third - based own resource.

The main data source used in the development of this sector accounts sequences is the Balance of Payments.

This statistical document drawn up by the National Bank, retraces economic and financial transactions (trade in goods and services, capital movements) occurring between Romania and outside during a given period.

**I. ACTIVITIES OF NATIONAL ECONOMY CLASIFICATION ACCORDING TO
DATA TRANSMISSION PROGRAMME TO EUROSTAT**

NACE Rev. 2 divisions	Description
01-03	Agriculture, forestry and fishing
05-09	Mining and quarrying
10-12	Manufacture of food products, beverages and tobacco products
13-15	Manufacture of textiles, wearing apparel and leather products
16-18	Manufacture of wood and paper products, and printing
19	Manufacture of coke and refined petroleum products
20	Manufacture of chemicals and chemical products
21	Manufacture of basic pharmaceutical products and pharmaceutical preparations
22-23	Manufacture of rubber and plastics products, and other non-metallic mineral products
24-25	Manufacture of basic metals and fabricated metal products, except machinery and equipment
26	Manufacture of computer, electronic and optical products
27	Manufacture of electrical equipment
28	Manufacture of machinery and equipment n.e.c.
29-30	Manufacture of transport equipment
31-33	Manufacture of furniture; other manufacturing; repair and installation of machinery and equipment
35	Electricity, gas, steam and air-conditioning supply
36-39	Water supply; sewerage, waste management and remediation activities
41-43	Construction
45-47	Wholesale and retail trade, repair of motor vehicles and motorcycles
49-53	Transportation and storage
55-56	Accommodation and food service activities
58-60	Publishing, audiovisual and broadcasting activities
61	Telecommunications
62-63	Computer programming, consultancy and related activities; information service activities
64-66	Financial and insurance activities
68	Real estate activities of which: imputed rents of owner-occupied dwellings
69-71	Legal and accounting activities; activities of head offices; management consultancy activities; architecture and engineering activities; technical testing and analysis
72	Scientific research and development
73-75	Advertising and market research; other professional, scientific and technical activities; veterinary activities
77-82	Administrative and support service activities
84	Public administration and defence; compulsory social security
85	Education
86	Human health activities
87-88	Social work activities
90-93	Arts, entertainment and recreation
94-96	Other service activities
97-98	Activities of households as employers of domestic personnel and undifferentiated goods and services production of households for own use
99	Activities of extra-territorial organizations and bodies Territorial correction CIF-FOB Correction

*The main definitions of non-financial
national accounts according to
European System of Accounts
(ESA) 2010 methodology*

THE MAIN DEFINITIONS OF NON-FINANCIAL NATIONAL ACCOUNTS ACCORDING TO EUROPEAN SYSTEM OF ACCOUNTS (ESA 2010) METHODOLOGY

Actual final consumption consists of the goods and services that are purchased by resident institutional units for directly meeting the human needs, whether individual, or collective.

Adjusted disposable income is the balancing item of redistribution of income in kind account. This account presents the households income by including the flows corresponding to the use of individual goods and services which these households receive free of charge.

Change in inventories is measured by the value of the inventories less the value of withdrawals and the value of any recurrent losses of goods held in inventories due to physical deterioration, or accidental damage or pilfering. Inventories include all goods, other than fixed capital goods, held at a given moment in time by producer units.

Current taxes on income, wealth, a.s.o. cover all compulsory, unrequited payments, in cash or in kind, levied periodically by general government and by the rest of the world on the income and wealth of institutional units, and some periodic taxes which are levied neither on the income, nor the wealth

Final consumption expenditure consists of the expenditure incurred by resident institutional units on goods and services that are used for the direct satisfaction of individual needs or wishes or the collective needs of the community members.

Final consumption expenditure of government includes two categories of expenditures:

- the value of the goods and services produced by general government itself, other than own-account capital formation, market output and payments for non-market output;
- purchases by general government of goods and services produced by market producers that are supplied to households, without any transformation, as social transfers in kind.

Final consumption expenditure of non-profit institutions serving households (NPISH's) includes expenditure by NPISHs on goods or services produced by market producers, that are supplied - without any transformation - to households for their consumption, as social transfers in kind.

Financial corporations sector includes all corporations and quasi-corporations, which are mainly involved in financial intermediation and/or auxiliary financial activities.

The financial corporations sector is subdivided into five sub-sectors:

- the central bank;
- other monetary financial institutions;
- other financial intermediaries, except insurance corporations and pension;
- financial auxiliaries;
- insurance corporations and pension funds.

Financial intermediation services indirectly measured (FISIM) a financial institution are measured by the balance between the reference rate and the rate actually paid to depositors and charged to borrowers. A 'reference rate' of interest is the rate at which both lender the unit wishing to receive interests on funds and borrower the unit whose own funds are insufficient to meet its needs would be happy to strike a deal. The total FISIM is the sum of the two implicit fees paid by the borrower and the lender.

General government sector consists of institutional units which are non-market producers, whose output is intended for individual and collective consumption and are financed by compulsory payments made by units belonging to other sectors, and institutional units principally engaged in the redistribution of national income and wealth.

The general government sector is divided into four sub-sectors:

1. Central government
2. State government
3. Local government
4. Social security funds

"General government" includes:

- General government units which were established based on a law in view to have judicial authority over other units on the economic territory, and to manage and finance a group of activities, principally providing non-market goods and services, intended for the benefit of the community; a corporation or quasi-corporation which is a government unit, if its output is mainly non-market and a government unit controls it;
- Non-profit institutions recognised as independent legal entities which are non-market producers and which are controlled by general government;
- Autonomys pension funds

Government collective final consumption comprises government expenditure for collective consumption (general public services, defence, public order and safety, economic affairs, environmental protection, housing and community amenities, general administration, regulation, dissemination of general information and statistics, research and development a.s.o.).

Gross balancing item of primary incomes concerns the resident units and institutional sectors as recipients rather than producers of primary income.

Gross disposable income is the balancing item of the income account and measures the part of the created value at the nation's disposal intended for final consumption and gross saving.

Gross domestic product (GDP), the main macroeconomic aggregate of national accounting, represents the final result of the production activity of resident producer units.

This aggregate could be calculated according to the following approaches:

Production approach:

a) $GDP = GVA + TP - SP$, where:

GDP = Gross domestic product (market prices)

GVA = Gross value added (basic prices)

TP = Taxes on product

SP = Subsidies on product

Expenditure approach:

b) $GDP = FC + GFCF + CS + (E - I)$, where:

FC = Final consumption

GFCF = Gross fixed capital formation

CS = Change in inventories

E = Exports of goods and services

I = Imports of goods and services

Income approach:

c) $GDP = C + GOS + OTP - OSP + TP - SP$, where:

C = Compensation of employees

GOS = Gross operating surplus

OTP = Other taxes on production

OSP = Other subsidies on production

TP = Taxes on products

SP = Subsidies on products

Gross fixed capital formation consists of resident producers' acquisitions, less disposals of fixed assets, during a given period, plus certain additions to the value of non-produced assets realised by the productive activity of producer or institutional units. Fixed assets are produced assets used in production for more than one year.

Gross (or net) national disposable income equals gross (or net) national income (at market prices) minus current transfers (current taxes on income, wealth, social contributions, social benefits and other current transfers) payable to non-resident units, plus current transfers receivable by resident units from the rest of the world.

Gross national income (at market prices) equals GDP minus primary income payable by resident units to non-resident plus primary income receivable by resident units from the rest of the world.

Gross national income (at market prices) is conceptually identical with Gross national product (GNP) (at market prices), as hitherto understood in national accounts generally. However, the GNP was compiled in a different way within the ESA 79 framework.

Gross operating surplus is the balancing item of the generation of income account and it corresponds to the remaining value added after deducting compensation of employees and the taxes on production.

Gross savings represent the balancing item of the use of disposable income account and it measures the part of gross disposable income that is not intended to final consumption expenditure.

Gross value added is the balancing item of the production account and measures the value newly created within the production process.

Household final consumption expenditure covers the expenditure for purchasing goods and services to directly meet the individual needs of the household members.

Households is the sector that consists of individuals or groups of individuals as consumers and as entrepreneurs producing market goods and non-financial and financial services (market producers) provided that the production of goods and services is not achieved by separate entities treated as quasi-corporations.

Imputed social contributions represent the counterpart to social benefits (less eventual employees' social contributions) paid directly by employers (i.e. not linked to employers' actual contributions) to their employees or former employees and other eligible persons.

Individual final consumption of household consists of households expenditure on purchasing goods and services in order to directly meet the individual needs of the households members, government expenditure for individual consumption (medical products, appliances and equipment, outpatient services, hospital services, public health services; recreational and sporting services, cultural services; education, family and children, unemployment, housing, social exclusion) and NPISH expenditure for individual consumption.

Industry represents a grouping of units with homogeneous production (formed by local kind of activity units). These units are characterised by unique activity i.e inputs of products and services, by production processes and outputs of homogeneous products.

Institutional sector all the institutional units which have a similar type of economic behaviour. Institutional units are grouped into sectors, according to the two following criteria, characteristic for their economic behaviour:

- producers class;
- the nature of activities and of their main economic function.

The resident institutional units (units whose center of interest is placed on the economic territory of a certain country) are grouped in five institutional sectors: non-financial corporations (S11); financial corporations (S12); general government (S13); households (S14); non-profit institution serving households (S15).

Institutional unit is an economic entity characterized by decision-making autonomy in the exercise of its principal function and keeps a complete set of accounts.

Intermediate consumption consists of goods and services consumed as inputs by a process of production, excluding fixed assets whose consumption is recorded as consumption of fixed capital and that are either transformed or used up by the production process.

Lending or borrowing is the balancing item of the capital account and shows the resources that the nation puts at the disposal of the rest of world (if positive) or that it receives from the rest of the world (if negative).

Market output includes products disposed of on the market or intended to be disposed of on the market at prices that are economically significant. By convention and according to national accounts rules, all the goods are considered to be sold on the market. The output of market services covers all services which could be purchased on the market and are produced by an economic unit whose resources are mainly covered by revenue from sales of their own output.

National accounting represents a coherent and detailed whole of accounts and tables, which gives a comparable and complete picture of the economic activity of a country. It classifies the wide variety of economic flows into a low number of basic categories inscribing them in a frame allowing for obtaining a representation of the economic circuit adapted to the analyses, forecasts and economic policies requirements.

The main accounts compiled within national accounting are:

- Goods and services account (0);
- Production account (I);
- Primary distribution of income account (II.1);
- Generation of income account (II.1.1);
- Allocation of primary income account (II.1.2);
- Entrepreneurial income account (II.1.2.1);
- Allocation of other primary income account (II.1.2.2);
- Secondary distribution of income account (II.2);
- Redistribution of income in kind account (II.3);
- Use of income account (II.4);
- Use of disposable income account (II.4.1);
- Use of adjusted disposable income account (II.4.2);
- Capital account (III.1);
- Change in net worth due to saving and capital transfers account (III.1.1);
- Acquisition of non-financial assets (III.1.2);
- Changes in assets (III.2);
- Other changes in volume of assets account (III.3);
- Balance sheets (IV);
- Rest of the world account (V).

Net property income covers the income of an enterprise which takes the form of interests, rents on land and intangible assets, rented for production purposes, dividends and other cashed income, after deducting the income of the same nature paid by the enterprise to other units (sectors, companies a.s.o.).

Net salaries received include the amounts received directly by the employees in return for their work (including bonuses, enhanced rates of pay, payments in kind) after deducting the social compulsory contributions of employees and tax on income.

Nominal sector As financial intermediation services indirectly measured (FISIM) cannot be distributed by types of uses, they are treated, by convention as the intermediate consumption of a nominal sector with zero output and negative value added equal in size but opposite in sign to intermediate consumption.

Non-financial corporations consist of institutional units which are independent legal entities and market producers, and whose principal activity is the production of goods and non-financial services. The non-financial corporations sector also includes non-financial quasi-corporations.

Non-market output represents the output produced by general government and NPISHs that are supplied free of charge, or at prices that are not economically significant, to other institutional units.

Non-profit institutions serving households sector consists of non-profit institutions which are separate legal entities, which serve households and which are private non-market producers. Their principal resources are voluntary contributions in cash or in kind from households in their capacity as consumers, from payments made by general government and from property income.

This institutional sector includes: religious organizations (of cults), trade unions, political parties, unions, foundations, cultural and sports associations.

Output consists of the products created during the accounting period.

Primary income is the income which resident units receive by virtue of their direct participation in the production process, and the income receivable by the owner of a financial asset or a tangible non-produced asset in return for providing funds to, or putting the tangible non-produced asset at the disposal of, another institutional unit.

Production for own final consumption includes the goods or services that are retained either for final consumption by the institutional unit or for gross fixed capital formation (only households can produce and retain output for own final consumption, for example, agricultural goods produced and consumed by members of the same household; goods or services used for own gross fixed capital formation can be produced by any kind of enterprise; they include, for example, machine tools produced for their own use by enterprises, dwellings or extensions to dwellings produced by households).

Rest of the world sector is characterized by a group of accounts that reflects transactions that occur between the resident units and the non-resident ones. The accounts specific to this sector give a global overview on the economic relationships connecting a country with the rest of the world.

Social benefits other than social transfers in kind consists of social security benefits in cash, private funded social benefits, unfounded employee social benefit, social assistance benefits in cash.

Social security benefits in cash include payments made for the benefits of their employees to the insurance enterprises.

Social transfers in kind consist of individual goods and services provided as transfers in kind to individual households by government units and NPISH's, whether purchased on the market or produced as non-market output by government units or NPISH's.

National accounts 2012-2013

They may be financed out of taxation, other government income or social security contributions, or out of donations and property income in the case of NPISH's.

Subsidies are current unrequited payments which general government or the institutions of the European Union make to resident producers.

Subsidies are classified into:

- subsidies on products (subsidies payable per unit of goods or services produced or imported);
- other subsidies on production (subsidies except subsidies on products which resident producer units may receive as a consequence of engaging in production activities).

Taxes on production and imports cover all compulsory, unrequited payments, in cash or in kind, levied periodically by general government and by the European Union units. Taxes on production and imports are divided into:

- taxes on products (due taxes on goods or services unit produced or transacted);
- other taxes on production (taxes paid by enterprises as a result of production activity independent of the amount or value of goods and services produced or sold).
