### I. GENERAL INFORMATION

The European System of Accounts version 2010 (ESA 2010) is the compulsory methodology used by European Union Member States to produce and publish their national accounts data since September 2014. ESA 2010 was adopted in the form of Regulation (EU) No. 549/2013 of the European Parliament and of the Council of 21 May 2013 on European system of national and regional accounts of European Union.

The system of national accounts aims to reflect the new economic realities as well as to satisfy the information needs of users in terms of the rapidity of publication of results and measurement of particular aspects, such as current expenses resulting from research and development and the defence industry or liabilities related to pension schemes.

At the same time, the ESA 2010 is broadly consistent with the rules established by the System of National Accounts version 2008, worldwide-accepted (SNA 2008). It nevertheless incorporates certain differences regarding its presentation and the higher precision of certain concepts, which are more in line with the structure of member states economies and its specific use in EU, keeping the comparability of the EU data with the compiled data by the Community main international partners.

The ESA 2010 Regulation comprises binding methodological rules and a compulsory transmission program defining the accounts and tables to be provided by all Member States in accordance with the time limits. The Regulation covers the annual, quarterly and regional national accounts, as well as government finance statistics.

ESA 2010 represents a coherent set of standards, definitions, classifications and accounting rules which are necessary to enable the compilation of national accounts by member states in a comparable manner and aiming the common objectives of European Union. Moreover, ESA 2010 serves as reference framework for social and economic statistics of EU and member states.

Implementation of the ESA 2010 has imposed a retroactive revision of ESA 95 time series of annual, quarterly and regional national accounts data, together with general government statistics.

## **II. GENERAL CHARACTERISTICS**

### **1. Regrouping of institutional units into institutional sectors**

The classification of units into institutional sectors is obtained by taking into consideration two representative characteristics for their economic behaviour, as follows: the category of producers the unit belongs to and the nature of their activities and main functions.

ESA provides information for the following institutional sectors:

- Non-financial corporations (S11);
- Financial corporations (S12);
- General government (S13);
- Households (S14);
- Non-profit institutions serving households (NPISHs) (S15);
- Rest of the world (S2).

During the classification process of institutional units, their characteristics are analysed resulting in cases of re-classification of units from an institutional sector to another. The most frequent re-classifications are applied for companies from non-financial corporations sector to general government sector, based on the quantitative criteria of 50% (if less than 50% of the company's expenses are covered by their own income from the sale of its production). According to ESA 2010, the 50% criteria is complemented by qualitative criteria, as following:

- if the producer sells its output entirely, or over 50%, to general government, without entering into competition with private producers;
- if the producer does not take action to adapt its resources to achieve an adequate profit to operate under market conditions and to meet its financial obligations.

Impact on GDP and GNI is determined by the difference between its output, calculated as the sum of cost and its market output represented by its market sales. Data sources used for the application of quantitative criteria were profit and loss accounts of state-owned companies. In order to apply qualitative criteria, a questionnaire with specific questions was developed in collaboration with the Ministry of Public Finances, filled in by all units owned and controlled by the state.

For the reclassified units, the complete sequence of national accounts is compiled.

### **2. The sequence of accounts of institutional sectors**

ESA is built around a sequence of accounts inter-connected by balancing items.

The main non-financial accounts elaborated in the framework of national accounting are the following:

- goods and services account (0);
- production account (I);
- primary distribution of income account (II.1);

- generation of income account (II.1.1)
- allocation of primary income account (II.1.2)
  - entrepreneurial income account (II.1.2.1)
  - allocation of other primary income account (II.1.2.2)
- secondary distribution of income account (II.2);
- redistribution of income in kind account (II.3);
- use of income account (II.4);
  - use of disposable income account (II.4.1)
  - use of adjusted disposable income account (II.4.2)
- capital account (III.1);
  - change in net worth due to saving and capital transfers account (III.1.1)
  - acquisitions of non-financial assets account (III.1.2)

In general, the accounts are balanced merely by using balancing items. The most significant balancing items are: value added, operating surplus/ mixed income, balance of primary income, disposable income, saving and lending/borrowing; they are expressed in gross value. Transition from gross to net value is achieved by excluding consumption of fixed capital.

### **3. Valuation based on accrual principle**

Taxes, subsidies, social contributions and interests should be recorded at their value at the moment the activities or operations that give rise to the payment obligation take place, that is on the basis of the accrual principle and not at the value of the actual paid amounts. In the framework of Romanian national accounts, the value of taxes, subsidies, social contributions is recorded on the basis of accrual principle by adjusting budgetary revenues. The adjustment is aimed at correcting the one-month gap between the moment when the transaction that generates taxes or contributions takes place and the moment of payment to the state budget.

### **4. Concepts of final consumption: final consumption expenditure and actual final consumption**

The two concepts of final consumption make the distinction between the expenditure made by a sector for the purchase of goods and services with the aim of consumption (final consumption expenditure) and the value of goods and services consumed by the same sector (actual final consumption).

The difference between the two concepts stands in the way of approaching certain goods and services that are financed by the general government or by non-profit institutions serving households (NPISHs) and are delivered to households as social transfers in kind.

Final consumption expenditure (P.3) is made up of:

- the households final consumption expenditure;
- the general government final consumption expenditure, including both the expenditure for individual goods and services and collective expenditure;
- the final consumption expenditure of non-profit institutions serving households.

### ***National Accounts 2020 – 2021***

Individual consumption expenditure (P.31) covers goods and services (called “individual”) acquired by households to meet their members needs.

Collective consumption expenditure (P.32) covers services simultaneously supplied to all community members or to certain segments of it.

The whole final consumption expenditure of households is considered as intended for individual consumption. By convention, all goods and services supplied by non-profit institutions serving households are considered as individual.

The goods and services supplied by general government can be destined for collective consumption (expenditure for general government, national defence, public order, environment protection, research, etc.) or for individual consumption (expenditure on health, education, sport and entertainment activities, culture, collection of household waste).

## **5. The coverage of Gross Fixed Capital Formation (GFCF)**

The coverage of gross fixed capital formation is a permanent source for methodological improvements, by including, in addition to acquisitions less disposals of tangible fixed assets, of acquisitions less disposals of intangible fixed assets namely: mineral exploration, software and databases, recreational works, literary or artistic originals, research and development including research and development freely available and other intellectual property rights.

Certain components of the gross fixed capital formation will be further evidenced because they require a special approach during the estimation process.

ESA 2010 treats **research-development**, acquired or produced on own account, as gross fixed capital formation.

According to ESA 2010, the impact of capitalisation of research-development on national accounts is different in the case of a market producer and non-market one:

i. In the case of a market producer, expenditure is reclassified from intermediate consumption to gross fixed capital formation. The effect is the increase of gross domestic products (GDP) and gross national income (GNI) by this amount.

ii. In the case of a non-market producer (government owned) research and development expenditures are already included in the value of output. Output, and thus gross value added (GVA) is increased only by the amount of fixed capital consumption estimated for it. The output value for research and development is reclassified from collective consumption of general government to gross fixed capital formation. The effect is the increase of GDP and GNI by the value of fixed capital consumption.

ESA 2010 extends the coverage of **military capital goods** by including military weapons and support systems even if they do not have a civil destination. This includes military vehicles, warships, submarines, military aircraft, tanks, etc. which are used for more than one year for defense services.

Consequently, GDP and GNI is increased by the amount of military equipment purchased rerouted from intermediate consumption to gross fixed capital formation, supplemented by the consumption of fixed capital value calculated for the equipment.

According to ESA 2010, the **small tools** used in production for more than one year are recognised as gross fixed capital formation, not as stocks of material, no matter their value. Consequently, GDP and GNI increase by the value of small tools.

ESA 2010 introduces a new category of capital goods, **land improvements** (soil improvement works, flood prevention, reforestation, etc.) that is included in gross fixed capital formation, being removed from intermediate consumption. As a result of these changes, GDP and GNI increase accordingly.

## **6. FOB valuation of imports and exports of goods and services**

Imports and exports of goods and services should be evaluated at FOB prices (free on board), meaning that a CIF-FOB correction is made on CIF prices (cost, insurance, freight) of imports.

The CIF price is the price of a good at the border of importing country or the price of a service delivered to a resident before the payment of any import duties or other taxes on imports or trade and transport margins within the country.

The FOB price comprises:

- the value of goods at basic prices;
- the value of transport and distribution services up to the frontier, including costs of loading on board of a transport mean;
- taxes minus subsidies on exported goods.

## **7. Financial services**

The most important financial services are represented by financial intermediation (including the insurance and pension services), for which explicit or indirect payments are made. The Financial intermediation services indirectly measured (FISIM) of a financial institution is measured as difference between the reference rate and rate actually paid to depositors and charged to borrowers. The reference rate is not directly observed, thus the FISIM compilation is based on a specific method developed according to ESA 2010 requirements. FISIM is not compiled for central bank.

Financial intermediation services indirectly measured are divided between intermediate consumption, final consumption and exports. FISIM related to intermediate consumption are in their turn allocated by institutional sectors and by industry. Estimations for the allocation of FISIM by institutional sector and industry are performed based on results obtained from surveys conducted within the units belonging to the financial-banking sector.

### ***National Accounts 2020 – 2021***

Improvements of the methodology for estimating **insurance activities** were implemented according to ESA 2010 recommendations on specific calculations for these activities. Data sources used are the balance sheets of insurance corporations and annual reports of the Financial Supervisory Authority. The compilation method of the insurance activities output takes into consideration the following aspects:

- the output for general insurance is compiled as difference between the earned premiums and additional premiums, and paid claims adjusted by equalization reserve to prevent the occurrence of a negative output in the case of exceptionally high damage (in case of natural disasters, catastrophes, a.s.o.);
- the output of reinsurance is calculated as the difference between earned premiums to which additional premiums (income from the investment of technical reserves) are added, and claims paid.

ESA 2010 states that for **Central Bank**, the share of its output represented by commissions must be allocated to non-resident units (exports) and resident units, thus GDP and GNI increase accordingly.

### **8. Improving the coverage of national accounts including non-observed economy**

ESA 2010 requires to estimate and include in national accounts all the productive activities (legal or illegal) that are carried out within the economy. A special attention is paid to the estimation of hidden (non-observed) economy, following the methodological recommendations of European Commission. These general methodologies are adapted and developed by each member state in order to reflect its own economic reality. In Romania, the estimates for non-observed economy cover the activities of the following institutional sectors:

- non-financial corporations, by including the estimation of black labour and VAT evasion;
- households, by including the estimations concerning the family associations and self-employed persons, fiscally non-registered activities such as teaching private lessons, accommodation, construction, as well as tips received for certain services: construction, trade, hotels and restaurants, transports, communication, health etc.

### **9. Delimiting Mixed income within generation of income account**

In the case of unincorporated enterprises, family associations and self-employed in the households sector, the balancing item of the generation of income account implicitly contains an element corresponding to remuneration for work carried out by the owner or his family members which cannot be distinguished from his profits as entrepreneur. This item called "mixed income" is separately identified.

**10. Classifications used**

The compilation of national accounts by industries is made on the basis of **the national system of general interest economic classification**, particularly the Classification of national economy activities and the Classification of products and services associated to activities, in force at the time.

Starting 1<sup>st</sup> January 2008 the **Classification of national economy activities, Revision 2 (NACE Rev.2)** and the **Classification of products and services associated to activities, version 2008 (CPA 2008)** were implemented in Romanian national accounts.

The historical series were revised according to the classifications in force, in order to make coherent the time series of national accounts by industries. The present publication contains the national accounts for 2020-2021 elaborated according to NACE Rev.2 and CPA 2008 classifications.

**III. NON-FINANCIAL NATIONAL ACCOUNTS FOR THE YEARS 2020-2021**

The national accounts data for year 2020 were revised following the implementation of GNI reservations according to the Eurostat requirements.

The gross domestic product obtained in 2021 amounted to 1189089.8 millions lei, increasing with 5.7% compared to the previous year. The gross domestic product per capita grew with 6.6% in year 2021 comparing to 2020, reaching 62170.4 lei per capita.

The structure of gross domestic product by categories of resources in 2021 had the following characteristics:

- services registered, as for previous years, the most important contribution to the formation of GDP (708367.3 millions lei, accounting for 59.6% of the total);
- the second place was taken by the industry (233854.1 millions lei, respectively 19.7% of the total);
- the contribution of agriculture, forestry and fishing was nearly a fifth part of industry, namely 56631.5 millions lei, representing 4.8 % of GDP;
- the construction sector had a 6.4 % contribution to GDP formation.

**Table 1: Gross domestic product by resources**

	Millions of lei current prices		Structure (%)	
	2020	2021	2020	2021
<b>GROSS DOMESTIC PRODUCT</b>	<b>1066780.5</b>	<b>1189089.8</b>	<b>100.0</b>	<b>100.0</b>
Agriculture, forestry and fishing	44579.2	56631.5	4.2	4.8
Industry	213314.6	233854.1	20.0	19.7
Construction	69893.6	75895.3	6.6	6.4
Services - total	639812.6	708367.3	60.0	59.6
Gross Value Added (GVA) - total	967600.0	1074748.2	90.7	90.4
Net taxes on product	99180.5	114341.6	9.3	9.6

### National Accounts 2020 – 2021

Analysing GDP structure by main resources during 2020 - 2021 one can see that the high share of services and industry in total GDP was maintained, the share of construction decreased and the share of agriculture increased in total GDP.

As noted in the table above, construction sector recorded a decrease of 0.2% comparing to previous year, to this evolution contributing the non-residential and infra-structure components.

A significant contribution to GDP growth came from the services sector, the industry experienced a mild decrease.

**Graph 1: Structure of gross domestic product by categories of resources - %**

The share of total gross value added (GVA) in gross domestic product was 90.4% in 2021 revealing a slight decrease compared to 2020.

The annual variation of GDP and GVA, respectively, by categories of resources, during 2020 - 2021, is presented in the table below:

**Table 2: The annual variation of gross domestic product by categories of resources**

	% as against previous year	
	2020	2021
<b>GROSS DOMESTIC PRODUCT</b>	<b>-3.7</b>	<b>5.7</b>
<b>Gross Value Added</b>	<b>-3.4</b>	<b>5.3</b>
- in agriculture <sup>1)</sup>	-15.3	13.7
- in industry <sup>2)</sup>	-6.5	0.9
- in construction	4.3	1.5
- in services	-2.2	6.6

1) Including forestry and fishery

2) Including electric and thermal energy, gas and water.

### National Accounts 2020 – 2021

The gross domestic product calculated by expenditure approach is the sum of actual final consumption expenditure, gross capital formation and net exports of goods and services.

**Table 3: Gross domestic product by categories of uses**

	Millions of lei current prices		Structure (%)	
	2020	2021	2020	2021
<b>GROSS DOMESTIC PRODUCT</b>	<b>1066780.5</b>	<b>1189089.8</b>	<b>100.0</b>	<b>100.0</b>
Actual final consumption	850990.8	943630.4	79.8	79.4
- Actual individual final consumption of households	736836.3	823920.3	69.1	69.3
- Actual collective final consumption of general government	114154.5	119710.1	10.7	10.1
Gross fixed capital formation	251016.2	288381.2	23.5	24.3
Change in stocks	10404.0	23956.4	1.0	2.0
Acquisitions less disposals of valuables	304.9	556.6		
Net exports of goods and services	-45935.4	-67434.8	-4.3	-5.7
- Exports of goods and services	393392.0	482663.4	36.9	40.6
- Imports of goods and services	439327.4	550098.2	41.2	46.3

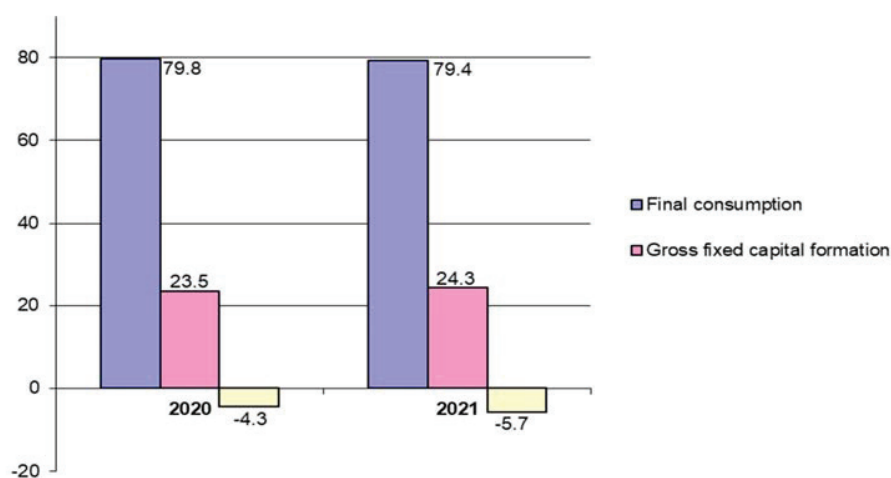

In 2021 actual final consumption amounted to 943630.4 millions lei, which accounted for 79.4% of GDP recording a decrease of 0.4% comparing to the previous year.

The actual individual final consumption of households, the most important component of actual final consumption, was 823920.3 millions lei that is 69.3% of GDP, increasing with 0.2% as against 2020.

As for the actual final collective consumption of general government, it reached 119710.1 millions lei in 2021 accounting for 10.1% of GDP, this component experiencing a decrease of 0.6% compared to the previous year.

Gross fixed capital formation (GFCF) amounted to 288381.2 millions lei accounting for 24.3% of GDP in 2021, and revealing an increase of 0.8% compared to 2020.

**Graph 2: Gross domestic product by categories of uses - %**

### ***National Accounts 2020 – 2021***

Total export of goods and services was 482663.4 millions lei accounting for 40.6% of GDP showing an increase of 3.7% as against 2020.

Total import of goods and services was 550098.2 millions lei accounting for 46.3% of GDP, recorded an increase of 5.1% as against 2020.

During the analysed period, imports of goods and services was almost equal to exports and this fact is highlighted by the balance of trade, respectively net exports of goods and services; discrepancy import – export was 1 to 0.99 that is for each 1 leu for imports of goods and services, the export was less with 1%.

The coverage rate of imports by exports showed a decrease (by 1.8%), from 89.5% in 2020 to 87.7% in 2021.

Significant changes in the coverage rate were registered in the following sectors: coke and refined petroleum products; construction; agriculture, forestry and fishing; wood and paper products, and printing; water supply and sanitation; transport equipment; transportation and storage; accommodation and food service activities; telecommunications; financial and insurance activities; advertising and market research; other professional, scientific and technical activities; veterinary activities; arts, entertainment and recreation; administrative and support service activities.

The analyse of efficiency in Romanian export operations is also reflected by the penetration rate of imports on the domestic market, which is calculated as a percentage ratio of import value in the domestic market.

Significant increases can be observed for: mining and quarrying; scientific research and development; electrical equipment.

**Table 4: The annual variation of gross domestic product by categories of uses**

	% as against previous year	
	<b>2020</b>	<b>2021</b>
<b>Gross domestic product</b>	<b>-3.7</b>	<b>5.7</b>
Total final consumption	-2.8	5.9
of which:		
- Actual final consumption of households	-3.7	6.8
Gross fixed capital formation	1.1	2.9

The Gross Domestic Product (GDP) calculated by income approach is the sum of value added elements (namely: compensation of employees, gross operating surplus, mixed income, net taxes on production) and other taxes minus subsidies on products.

Table 5: Gross domestic product by income method

	Millions of lei current prices		Structure (%)	
	2020	2021	2020	2021
<b>GROSS DOMESTIC PRODUCT</b>	<b>1066780.5</b>	<b>1189089.8</b>	<b>100.0</b>	<b>100.0</b>
Compensation of employees	420720.7	449335.8	39.4	37.8
of which:				
Gross salaries and allowances	401733.3	428448.7	37.7	36.0
Other taxes on production	8401.7	9690.8	0.8	0.8
Other subsidies on production	-16317.1	-11745.4	-1.5	-1.0
Gross operating surplus including mixed income	554794.7	627467.0	52.0	52.8
Gross Value Added (GVA)	967600.0	1074748.2	90.7	90.4
Net taxes on products	99180.5	114341.6	9.3	9.6

<sup>\*)</sup> Including Mixed Income

Analysing the structure of the gross domestic product calculated by income approach, one observe the following characteristics:

- compensation of employees contributed with 37.8% in GDP; in 2021 this component has decreased with 1.6% as against 2020;
- gross operating surplus (GOS), including mixed income, accounted for 52.8% of GDP.

Graph 3: The structure of gross domestic product by income approach - %

## CHAPTER 1

### GOODS AND SERVICES

---

This chapter presents the main elements of the macroeconomic balance between resources and uses of goods and services, preceding the detailed description of various components of demand and supply.

All transactions with goods and services are set out in the framework of the input-output table that presents the balance between resources and uses by product:

Output + Imports of goods and services + Trade and transport margins + CIF-FOB correction + Taxes on products - Subsidies on products = Intermediate consumption + Total final consumption + Gross fixed capital formation + Change in inventories + Exports of goods and services

as well as the production accounts by industries:

Gross value added = Output - Intermediate consumption.

Gross Domestic Product (GDP) is defined as the sum of all resources that ensure the final balance of uses of goods and services, except imports. Thus, for the total economy we have:

GDP + Imports of goods and services = Total final consumption + Gross fixed capital formation + Change in inventories + Exports of goods and services

Connecting this definition to the previous identities we obtain:

GDP = Sum of Gross values added of industries + Taxes on products - Subsidies on products.

The output is evaluated at basic prices (without invoiced VAT and other taxes on

products but including the subsidies on products), imports at FOB prices by adding the CIF-FOB correction, intermediate consumption and final uses at purchase prices and exports at FOB prices.

The decomposition into volume and price components is the one in which the volume is measured using the prices of the previous year.

The change "in volume" of gross domestic product is considered to be a synthetic indicator of the changes occurred in the national economy activity, measured on the basis of the previous year prices. By comparing the change in volume with that in value of the gross domestic product it is possible to calculate the implicit change of the GDP price representing an aggregation of all changes in prices used for compiling the input-output table. Therefore, the implicit price index of GDP can be considered as an indicator of the general evolution of prices in economy.

The contributions to the volume change of GDP are calculated based on the formula that defines GDP as a sum of all final uses of goods and services, except imports of goods and services. The contribution of any component of final uses to the volume change of GDP is defined as a percentage ratio between the change in volume of this component between year "n-1" and year "n" and the value of GDP in year "n-1". Through this type of calculation the sum of the contributions of different components is equal with the growth rate of GDP between year "n" and year "n-1".

1) For (the years) 2019 - 2020 we used the resident population on July 1 of each year

2) Active population was recalculated according to the resident population against the criteria of habitual residence under comparability with the results of Population and Housing Census - 2011

3) Revised data.

C = confidential data

The objective of this chapter is the accounting and economic description of production, as a whole and by industries. The aggregates of the generation of income account by industries are also presented: compensation of employees, gross operating surplus and mixed income.

All aggregates are detailed by industries, as the most detailed item used for the production analysis. The industry groups together all units engaged in a homogeneous activity. The industrial classification is based on the Classification of Activities in National Economy (NACE, rev. 2).

The main aggregates are:

- a) Output of goods and services
  - b) Gross value added
  - c) Gross operating surplus
  - d) Mixed income, gross
- a) Output comprises all the goods and services created during the accounting period, usually a calendar year.

Three types of output can be distinguished:

- market output of goods and services, that is output sold at prices that are economically significant or otherwise disposed of on the market, or intended for sale or disposal on the market. By convention, and according to national accounts rules, all the goods are considered to be sold or disposal on the market. The output of market services covers all services which are produced by units for which over 50 per cent of costs are covered by revenue from sales of their own output;
- output for own final use consists of goods and services that are retained for own final consumption or for capital formation by the same institutional unit in which they are produced. As corporations have no final consumption, output for own final consumption is produced only by unincorporated enterprises: for example, agricultural goods produced and consumed by members of the same household. Goods or services used for own gross fixed capital formation can be produced by any kind of enterprise. They include, for example, machine-tools or

construction produced for their own use by enterprises, dwellings or extensions to dwellings produced by households;

- other non-market output consists of goods and individual or collective services produced by general government and NPISHs that are supplied free, or at prices that are not economically significant, to other institutional units or the community as a whole.
- b) Gross value added is the balancing item of the production account and is defined as the value of output less the value of intermediate consumption; it is therefore the value newly created within the production process.
- c) Gross operating surplus is the balancing item of the generation of income account showing what remains of the value added after deducting the compensation of employees and taxes less subsidies on production. The way of calculating the gross operating surplus is the following:

Gross value added

+ Other subsidies on production

- Other taxes on production

- Compensation of employees

= Gross operating surplus

- d) Mixed income is defined as the accumulated surplus or deficit production by individual enterprises in the household sector. It implicitly contains an element of remuneration for work done by the owner, or other members of the household, which can not be identified separately from the owner's income as an entrepreneur, but excludes the operating surplus coming from owner-occupied dwellings.

In general, mixed income is presented with gross operating surplus.

Using the indicators of the production and generation of income accounts, the gross domestic product (GDP) – the main macroeconomic aggregate – can be derived by the following approaches:

*Production approach*

$GDP = GVA + TP - SP$

where:

GDP = Gross domestic product (at market prices)

GVA = Gross value added (at basic prices)

TP = Taxes on products

SP = Subsidies on products

*Income approach*

$GDP = CE + GOS/MI + OTP - OSP + TP - SP$

Where:

CE = Compensation of employees

GOS/MI = Gross operating surplus

OTP = Other taxes on production

OSP = Other subsidies on production

The main data sources used for the compilation of production and generation of income accounts are:

a) Statistical data sources:

- the Structural Business Survey;
- the Households Labor Force Survey;
- the Households Budget Survey;
- the balance of agricultural products.

b) Accounting and financial data sources:

- the annual accounting statements of financial institutions;

- the annual accounting statements of non-financial enterprises;

c) Other administrative data sources:

- information from the execution of the consolidated general government budget;
- the outcomes and expenses of public institutions, partially or totally financed by extra-budgetary funds;
- the balance of payments from the Romanian National Bank;
- the income declarations made to the Ministry of Finance by the self-employed and family associations.

The Structural Business Survey is the main data source used to produce national accounts and to spotlight the specific indicators for each sector providing a complete picture of the national economy structure by industry, type of ownership and regions.

The Households Labor Force Survey provides essential data on the activity of different population groups.

The Households Budget Survey is a regular survey conducted to obtain information for describing the population incomes and expenditures and their evolution over time.

This chapter presents the evolution of the domestic demand main components: total final consumption, final consumption expenditure of households, gross fixed capital formation, and change in inventories.

### **1. Total final consumption**

According to ESA, two concepts of final consumption can be distinguished:

- final consumption expenditure;
- actual final consumption.

Final consumption expenditure refers to expenditures made by a sector in order to purchase goods and services with the aim of consumption. Actual final consumption refers to all purchased goods and services actually consumed by a sector. The difference between the two concepts is the treating way of certain goods and services that are financed by the general government or by the non-profit institutions serving households (NPISHs) that are delivered to households as social transfers in kind.

#### **1.1 Final consumption expenditure of households**

Final consumption expenditure of households, as defined by the national accounts, consists of expenditures on all goods and services incurred by households to satisfy their individual needs. It covers all market goods and services as well as the households' consumption of own-account production of agricultural and non-agricultural products (produced within the households) and services (housing services of owner-occupied dwellings).

The national final consumption represents the consumption of resident households no matter if it takes place on the economic territory or in the rest of the world. The balance between the final consumption of residents in the rest of the world and the final consumption of non-residents on the economic territory cannot be distributed by products being globally affected to an item called "territorial correction".

Final consumption expenditure of households includes all purchases of durable goods except dwellings and equipment acquired by sole proprietors and family associations. The expenses for current maintenance of dwellings are in the final consumption while the major renovations of

dwellings are included in the gross fixed capital formation. Final consumption expenditure of households is valued at purchasers' prices for the market goods and services and at producers' prices for those self-consumed.

### **2. Gross fixed capital formation**

Gross fixed capital formation (GFCF) consists of resident producers' acquisitions, less disposals of fixed assets in a given period plus certain additions to the value of non-produced assets stemming from the productive activity of producers or institutional units. Fixed assets are produced assets used in production for more than a year.

GFCF includes:

- dwellings;
- other buildings and structures, these include major improvements of the land;
- machinery and equipment;
- weapons systems;
- cultivated biological resources, as trees and livestock;
- costs of ownership transfer of non-produced assets such as land, contracts, leases and licenses;
- research and development (R&D), including the production of freely available R&D;
- exploration and mining evaluations;
- computer software and databases;
- entertainment, literary and artistic originals;
- other intellectual property products.

The acquisitions of land and intangible assets are excluded from the GFCF, being recorded in the uses of the capital account of institutional sectors.

GFCF does not include the value of market research or advertising activities which are recorded as intermediate consumption. Purchased goods and services included in GFCF are valued at purchasers' prices excluding deductible VAT; own-account

production for own fixed capital formation is valued at production costs.

GFCF is estimated:

- by institutional sectors; GFCF by institutional sector is calculated as the difference between purchases and sales of existing capital goods. All institutional sectors reveal in their accounts GFCF. The "Households" sector applies GFCF only to purchases of dwellings;
- by product; GFCF by product and for the economy as a whole refers to acquisition of new fixed assets only.

### **3. Change in inventories**

Inventories represent all goods stored by resident units for future use, further processing or sale.

Inventories are classified into:

- users' inventories, covering raw materials and other supplies, breeding stock, young animals being fattened, equipment for investments etc., which are stored by the user in order to be used for production;
- producers' inventories, covering finished goods and work-in-progress stored by producers;

- trade inventories, covering goods for re-sale stored by commercial agents.

Change in inventories is estimated as a difference between the closing and opening stock values.

In business accounting, opening and closing stock values are recorded at their historic cost. That is not in line with the national accounts methodology which recommends that goods withdrawn from inventories should be valued at the prices prevailing at the time the goods are withdrawn rather than at the prices at which they entered inventories.

Therefore, and also as a consequence of the price changes in time, the change in inventories based on the business accounting could be over or under-estimated including accordingly holding gains or losses. According to the national accounts methodology these should be eliminated.

Therefore, the change in inventories of the national accounts, called "economic change in inventories", is not equal to the change in inventories of the business accounting, also called "accounting change in inventories", the difference representing holding gains or losses.

This chapter contains the main information concerning the exchange of goods and services between the Romanian economy and the rest of the world.

### **1. Imports and exports of goods**

The imports and the exports of goods are calculated based on the custom statistics. For the products that are not covered by custom statistics, statistical reports are drawn up. For goods transported by cable or pipes, as natural gas and electricity, the change of ownership principle is used.

The imports and exports of goods are valued at FOB prices.

The imports / exports of goods include:

- sales/purchases of goods by resident units to/from non-resident units;
- barter trade;
- goods received or given as international aid;
- goods provided in Romanian ports and airports to non-resident carriers and those provided in foreign ports and airports to Romanian carriers;

According to ESA 2010, goods sent abroad for processing are not considered exports when leaving the country, but neither imports when sent back to country, because no change of ownership occurs. For national accounts, physical movement of goods is not important, what matters is only the change of ownership.

The processing fees are included into intermediate consumption for the owner of the goods. In the country where processing takes place, the goods are not considered imports when entering the country or exports when leaving the country, the processing fee is export of services.

In Input-output table, the imports of goods are valued at CIF prices for all groups of products.

The transition from CIF to FOB valuation of the total value of imported products is made by inserting an adjustment line within the resources and uses framework.

### **2. Imports and exports of services**

The data concerning the imports and the exports of services are obtained from Balance of Payments compiled by National Bank of Romania.

The external exchange of services between the resident and non-resident units covers:

- services for processing goods
- maintenance and repair services;
- transport services, postal and courier services;
- tourism services;
- construction services;
- insurance and pension funds;
- financial services;
- fees for the use of intellectual property;
- telecommunications services, computer and information;
- business services;
- personal, cultural and recreational services;
- services for government such as local expenses by foreign embassies;

### **3. Competitiveness indicators**

The export effort is calculated as a percentage ratio between the value of exports and domestic output.

The covering rate of imports by exports is calculated as a percentage ratio between the value of exports and imports.

The penetration rate of foreign products on the domestic market is calculated as a percentage ratio between the value of imports and domestic markets (output + imports - exports).

#### 04.01 EXPORT EFFORT, COVERING RATE AND PENETRATION RATE BY PRODUCTS

### 1. Categories of prices used by the national accounting

The flows recorded by the national accounting represent economic transactions measured in terms of money. The value of a transaction can be directly factored into two components: number of quantitative units and the price at which each of these elementary quantitative units is exchanged. For an elementary product this can be expressed by the following equation "value = quantity x price" and by its correspondent in terms of evolution "value index = volume index x price index".

In different positions of the national accounts are generally found transactions involving more than one elementary product. The measurement of the change in volume and price leads to the necessity of aggregation of the individual indices corresponding to elementary products. The aggregated volume index is a Laspeyres type index. The aggregation of individual indices is done by weighting with the base period values. The aggregated price index is a Paasche type index calculated by aggregating the individual price indices using as weights the values of the current period.

#### 1.1 Prices of the gross value added

Once the price indices for output and intermediate consumption for market goods and services are available, price indices for different components of production account of industries with market production could be calculated. In particular, one can calculate gross value added in constant prices as a difference between goods and services

output in constant prices and intermediate consumption in constant prices. This estimation method is called "double deflation" due to the fact that value added in the prices of the base period is not directly evaluated by using a specific price index, but by separate deflation of the elements whose balancing item is.

### 2. The system of price indices used in the Romanian national accounts

For the constant price valuation of the main aggregates of the national accounts, the prices of the previous year are used. This is done within the framework of the input-output table in constant prices.

In order to deflate the aggregates of the national accounts several price indices series are used:

- Consumer price indices;
- Producer price indices;
- Indices of prices on the farmers' market;
- Price indices of agricultural production;
- Price index of construction;
- Unit value indices of imports and exports of goods;
- Price indices derived within the framework of the balance of resources and uses by products and used to deflate intermediate consumption, gross fixed capital formation, change in inventories, trade margins, taxes and subsidies on products.

The European Commission Regulation on the ESA 2010 Transmission Programme requires Member States to disseminate the annual and quarterly data on employment, compiled according to national accounts concepts.

Disseminated data refers to employment (employees and self-employed) according to the classification of national economic activities (NACE Rev. 2). The units of measure are “thousands persons” and “thousands hours worked”.

**Employment** covers all persons – both employees and self-employed – engaged in some productive activity that falls within the production boundary from national accounts.

**Employees** are defined as all persons who principally work, based on a formal or informal agreement, for a resident institutional unit in exchange for a salary or remuneration equivalent.

**Self-employed persons** are defined as persons who are the sole owners, or joint owners, of the unincorporated enterprises without legal personality, in which they work. In this category are included: unpaid family workers, including those working in unincorporated enterprises engaged in market production, outworkers whose income is a function of the value of the outputs from some process of production for which they are responsible and workers engaged in production undertaken entirely for their own final consumption or own capital formation, either individually or collectively. In order to compare the outcome of the units' productive activities with the employment, one should take into account the resident and non-resident persons employed by the resident productive units – the so-call **domestic concept**.

In this sense, the base data are adjusted as following:

- nationals who are on the staff of diplomatic missions abroad are added;
- non-resident workers employed less than one year into activities in the Romanian economic territory are added;
- resident workers who work in another economic territory are subtracted.

According to ESA, there are taken into compilation both principal and secondary activities of employed persons, based on **hours actually worked**.

The main **data sources** used to estimate employment are the following:

- Households labour force survey (AMIGO);
- Survey on the labour cost (S3);
- Structural business survey (SBS);
- Administrative data sources (information from Ministry of External Affairs, Ministry of Labour, Family Social Protection and Elderly People, Ministry of Internal Affairs, etc.);
- Financial statements of financial corporations.

Tables on employment which are included within the present chapter are similar to the ones transmitted according to the Regulation, being revealed both annual and quarterly estimates for the reference years in publication.

**06.01 EMPLOYMENT, BY PROFESSIONAL STATUS AND  
BY ACTIVITIES OF NATIONAL ECONOMY**

This chapter presents the main aggregates as accounting balancing of non-financial accounts of institutional sectors, respectively the incomes created in the national economy (value added, operating surplus and mixed income), the incomes preserved or acquired by residents (disposable incomes) and those being saved. These savings are mostly used for investments (GFCF, change in inventories and net purchases of land and intangible assets). For the national economy as a whole, the difference between savings and investments (gross capital formation), except capital transfers, if it is negative is financed by the rest of the world and, in this

case, we record a net borrowing of the nation; in the case of a positive difference, this is used to finance the rest of the world and we record a net lending.

It is also to be noticed that, for each institutional sector, the net lending (net borrowing, respectively) allows net financing (net investments) of these sectors.

Gross capital formation is not enough to appreciate the investment effort: gross capital formation should be compared to the capital consumption to allow the evaluation of the capital net growth.

## 07.01 BALANCING ITEMS OF NON-FINANCIAL ACCOUNTS OF INSTITUTIONAL SECTORS

	- millions of lei, current prices -

## 07.02 THE SHARE OF GROSS DISPOSABLE INCOME IN GDP

	- % -	
	2020	2021
Gross disposable income of households		
of which:	C	C
- net wages received	25.3	24.2
- social benefits received	12.7	12.5
- current taxes on income and wealth	2.6	2.5
Gross disposable income of non-financial corporations	21.4	21.8
Gross disposable income of financial corporations	2.4	1.7
Gross disposable income of general government	13.7	14.4
Gross disposable income of NPISHs	0.9	0.4
Balance of incomes and transfers to the rest of the world	1.0	1.7
Gross domestic product	100.0	100.0

C = confidential data

Note : Revised data for 2020

### **1. Definition**

Non-financial corporations sector (S.11) includes all institutional units with legal status and whose main activity is the production of non-financial market goods and services.

### **2. Institutional sector accounts**

Table 08.01 describes in detail the sequence of accounts and their balancing items: production account (of which gross value added is pointed out), generation of income account (whose balancing item is the gross operating surplus (GOS)), the primary distribution of income account (resulting the gross balancing item of primary income which, for non-financial enterprises, is gross national income), the secondary distribution of income account of which balancing item is gross disposable income, the redistribution of income in kind account (the resulting balancing item being gross adjusted disposable income), the use of disposable income account from which results, as balancing item, the gross saving, the non-

financial assets account (which leads to the calculation of net lending (+) or borrowing(-).

### **3. Specific ratios**

These accounts allow the calculation of the ratios emphasising the destination of the gross value added and its evolution during the last years.

The investment ratio corresponds to the ratio between the gross fixed capital formation (GFCF) and gross value added. It is to be noticed that GFCF does not include net purchases of land and intangible assets that are separately recorded.

Two ratios of self-financing are calculated:

- "in restricted sense" as a ratio between gross saving and GFCF;
- "in extended sense" which has in addition to the nominator the balance of investment grants (D.92) and other capital transfers (D.99) and to the denominator acquisitions less disposal of non-produced non-financial assets (NP).

## 08.03 THE SHARE OF COMPENSATION OF EMPLOYEES AND OF GROSS OPERATING SURPLUS IN GROSS VALUE ADDED

	- % -	
	2020	2021
Compensation of employees	49.4	46.6
of which:		
-actual social contributions	1.2	1.2
Gross operating surplus	52.3	54.0

Note : Revised data for 2020

The households sector (S14) covers individuals or groups of individuals as consumers and possibly also as entrepreneurs producing market goods and market non-financial and financial services provided that, in the latter case, the corresponding activities are not those of separate entities treated as quasi-corporations.

### **1. The formation of gross disposable income (table 09.02)**

The constitution of gross disposable income (GDI) is accomplished in two steps: the distribution of the gross primary income and the net redistribution transfers.

The primary income comprises the incomes from activity directly linked to production factors and the property incomes.

The incomes from activity are incomes from work received by the employees, on one hand, and gross operating surplus and mixed income, on the other hand.

In the case of unincorporated enterprises in the households sector, the balancing item of the generation of income account implicitly contains an element corresponding to remuneration for work carried out by the owner or members of the family. This income has characteristics of wages and salaries, and characteristics of profit due to work carried out as an entrepreneur. This income is referred to as 'mixed income'.

Gross operation surplus of households corresponds to the incomes derived from dwelling services (actual and imputed rents of owner-occupied dwellings) and from domestic households' manufacturing production.

There are recorded as property incomes:

- the total incomes obtained as interests (actual interests – D41);
- rents (D45);
- distributed income of corporations (D42);
- dividends (D421) and withdrawals from income of quasi-corporations (D422).

These incomes do not follow a production activity carried out by a member of the household, but they have the characteristics of a primary distribution.

The net redistribution transfers comprise the following items:

- current taxes on income and wealth (D5);
- actual social contributions (D611) and imputed social contributions (D612);
- social benefits, other than social transfers in kind (received) (D62);
- other current transfers (D7).

These include:

- net non-life insurance premiums (D71);
- non-life insurance claims (D72);
- miscellaneous current transfers (D75).

The uses of the gross disposable income of households are individual consumption expenditure and gross saving. In resources side the Adjustments for the change in pension entitlements (D8) are recorded. The adjustment for the change in pension entitlements is needed to make appear in the saving of households the change in the pension entitlements on which the households have a definite claim.

The ratio between gross saving and gross disposable income is called saving ratio.

The gross saving, increased by the capital transfers received, is used for capital transactions (non-financial accumulation):

- gross capital formation (GFCF);
- change in inventories;
- acquisitions less disposals of non-produced non-financial assets;
- acquisitions less disposals of land and other tangible non-produced assets.

The balancing item is the net lending (+) or borrowing (-) of households, used for financial accumulation (financial account).

The ratio between the net lending (+) or borrowing (-) gross disposable income is called financial saving ratio.

### **2. Evolution and formation of wages and salaries (table 09.05)**

The compensation of employees (D1), which represents the primary income includes:

- gross wages and salaries (D11);
- employers' social contributions (D12).

It corresponds, from the point of view of labour cost, to the total expenditure made by the employer in direct counterpart with the use (the employment).

The evolution of gross wages and salaries (D11) paid to households by resident institutional sectors is presented in table 09.05 that emphasises the share paid by non-financial corporations and by general government.

Gross wages and salaries received by households are calculated by adding to the upper values the balancing item of wages transfers with the rest of the world.

The transition to the net wages, which represent the actual amount received by households, is accomplished by deducting from gross wages actual social contributions of households (D.613) and tax on income (D51).

**CHAPTER 10**

**GENERAL GOVERNMENT ACCOUNTS AND  
NON-PROFIT INSTITUTIONS SERVING HOUSEHOLDS ACCOUNTS**

---

## **1. General government**

### **1.1 Coverage of general government sector**

The general government sector (S.13) comprises all the institutional units, which are non-market producers and their output is intended for individual and collective consumption. Resources are obtained from compulsory payments paid by units belonging to other sectors or/and all institutional units whose main activity is the redistribution of national income and wealth.

The institutional units included in general government sector are as following:

- General government units which exist through a legal process to have judicial authority over other units in the economic territory, and administer and finance a group of activities, principally providing non-market goods and services intended for the benefit of the community;
- Corporations or quasi-corporations which are government units, if their output is mainly non-market and government units control them;
- Non-profit institutions recognised as independent legal entities which are non-market producers and which are controlled by general government;
- Public entities subordinated to general government for which the qualitative criteria (the criteria for the buyer of the public producer output) and quantitative criteria (50% criteria) are not met.

The institutional units of general government sector are regrouped into three subsectors:

- a) Central government (S.1311) which includes all administrative departments of the state and other central agencies whose competence extends normally over the whole economic territory; non-profit institutions controlled by central government and whose competence extends over the whole economic territory; market regulatory organisations which are either exclusively or principally distributors of subsidies;
- b) Local government (S.1313), subsector whose competence extends to only a local part of the economic territory, apart from

local agencies of social security funds (mayoralities, county councils, etc.);

c) Social security funds (S.1314) subsector includes central, state and local institutional units whose principal activity is to provide social benefits and which fulfil each of the following criteria:

- certain groups of the population are obliged, by law or regulation, to participate in the scheme or to pay contributions;
- general government is responsible for the management of the institution in respect of the settlement or approval of the contributions and benefits independently from its role as a supervisory body or employer.

### **1.2. The correspondence between taxes recorded in public accounting and taxes specific to national accounting**

Table 10.02 .A, B presents by row the three institutional subsectors which benefits of these incomes, and by columns the taxes specific to national accounting, i.e. compulsory payments received or not by the public administrations, excluding social contributions.

*The compulsory payments* include the following taxes: taxes on products (VAT, taxes and duties on imports except VAT, other taxes on products), current taxes on income and wealth (tax on profit, other current taxes).

### **1.3. Passage from budgetary balance to net lending /net borrowing of the general government sector (tables 10.03 A, B)**

The budgetary balance from the Finance Law is broken-down into a balance of final transactions (State budget) and a balance of temporary transaction (special funds accounts- annexes).

The flows between the state and other agents can be also described by the treasury transaction (not budgetary ones).

So, three subsectors of state can be set up: state budget, treasury special funds, and special funds budget (annexes).

Net lending of each sub-sector described above can be calculated as follows: from the state budget balance, the treasury accounts balance, special (annexes) funds accounts balance recorded by the public accounting, one subtract the balance of the financial transactions recorded in each budget (i.e. reimbursement of funds, payments or receipts of instalments, external credits, etc.); all these balancing items from public accounting are adjusted with the balances of financial transactions, obtaining finally the net lending/borrowing of the nation.

#### **1.4. Simplified accounts**

The revealed accounts refer to local government, general government and social security. These simplified accounts exclude the intermediate balances and imputed flows

(imputed contributions and benefits, final consumption, non-market output).

#### **2. Non-profit institutions serving households (NPISHs)**

Non-profit institutions serving household's sector (S.15) consists of non-profit institutions which are separate legal entities, which serve households and which are private non-market producers. Their principal resources, other than incidental sales, are voluntary contributions in cash or in kind of households in their capacity of consumers, from payments made by general government and from property income.

This sector includes, among other units, political parties, religious cults, trade unions, non-profit associations and foundations.

1) Swaps are contractual arrangements between two parties who agree to exchange, over time and according to predetermined rules, streams of payment on the same amount of indebtedness.

2) FRAs\* are contractual arrangements in which two parties, in order to protect themselves against interest rate changes, agree on an interest rate to be paid, at a specified settlement date, on a notional amount of principal that is never exchanged.

(\* = forward cote agreements)

3) Excessive Debit Procedure

Note : Revised data for 2020

Financial corporations sector (S.12) consists of institutional units which are independent legal entities and market producers, and whose principal activity is the production of financial intermediation services and financial auxiliary services.

This sector includes the following categories of units:

- National Bank;
- Romanian and foreign commercial banks;
- Savings Bank;
- Mutual insurance fund;
- Brokerage corporations;
- Financial investment corporations;
- Stock Exchange;
- Exchange offices;
- Credit co-operatives;
- Insurance corporations;
- Private pension funds, etc.

The output of financial corporations sector includes:

- the output of National Bank, providing monetary policy services, financial intermediation services, supervisory

- services overseeing financial corporations;
- banking services, other than the imputed output of banking services; this output comprises commissions, fees and banking expenses, incomes from other activities;
- financial intermediation services indirectly measured (FISIM) are measured, conventionally by the indirect banking charge (commission) resulting as amount of differences between reference rate of interest and the actual rate of interest paid to depositors by banks and paid by borrowers to banks;
- financial services output in acquiring and disposing of financial assets and liabilities in financial market, measured based on the margins between the buying and selling prices of the bonds and other securities.
- financial services output provided in insurance and pension schemes, when the activity is funded by insurance premiums and by the income from savings; they are measured, in general, by total premiums earned plus premium supplements (income earned on technical reserves) less adjusted claims incurred.

## CHAPTER 12

### REST OF THE WORLD SECTOR ACCOUNTS

---

This chapter presents the accounts of the relationships with the rest of the world, emphasising the transactions between the resident and non-resident units. The rest of the world sector is a grouping of units without any characteristic functions and resources; it consists of non-resident units insofar as they are engaged in transactions with resident institutional units, or have other economic links with resident units.

The main data source used in the development of this sector accounts sequences is the Balance of Payments.

This statistical document drawn up by the National Bank, registers economic and financial transactions (trade in goods and services, capital movements) occurring between Romania and abroad during a given period.

Note : Revised data for 2020

National accounts methodology is established to assess and measure the economic assets, as another important objective of the system. According to ESA 2010, an economic asset is a store of value representing the benefits accruing to the economic owner by holding or using the entity over a period of time. It is a means of carrying forward value from one accounting period to another.

**The economic assets** can be financial and non-financial. Within the non-financial accounts there are relevant **the stocks of non-financial assets** that are grouped, according to ESA 2010, as follows:

- Produced non-financial assets (outputs from production process):
  - Fixed assets
  - Inventories (of materials and supplies, work-in-progress, finished goods and goods for resale)
  - Valuables
- Non-produced non-financial assets:
  - Natural resources
  - Contracts, leases and licenses
  - Acquisitions less sales of goodwill and marketing assets

The stocks are holdings of assets and liabilities at one moment in time. The stocks are recorded at the beginning and at the end of each accounting period, thus they are measured at a given moment. The accounts which register stocks are called balance-sheets.

The main transaction recorded within the transition from the value of the stock in the beginning to the end of the accounting period is represented by gross fixed capital formation. Gross fixed capital formation (GFCF) is highly correlated with the assets from the national accounts point of view and with the variation of these assets during time.

The difference between the gross and the net value of the fixed capital stock and of the fixed capital formation is represented by **the consumption of fixed capital**. Consumption of fixed capital is the decline in the value of the fixed assets owned, as a result of normal wear and tear and obsolescence. Even if is different of it, the indicator can be assimilated to the depreciation from the business accounting, but estimated according to the ESA 2010 methodology.

The final value (net) of the asset stock is the one that is recorded in the balance sheet and the final stock of an accounting period is equal to the initial stock of the following accounting period.

According to ESA 2010, stocks of assets and consumption of fixed capital should be estimated on the basis of the **perpetual inventory method (PIM)**. Basically, capital stock is measured using PIM by summing up past purchases (less disposals) of capital goods, or investments.

This method is applied within the national accounts of Romania in the calculation of fixed assets stocks, obtaining, on each type of asset, values for:

- Opening stock (gross) in current and previous year replacement costs
- Final stock (gross) at current and previous year replacement costs
- Consumption of fixed capital at current and constant prices

Consumption of fixed capital (the difference between the gross and net value of stocks of fixed assets) resulted from the perpetual inventory method was compiled according to the linear depreciation model for each type of assets. Consumption of fixed capital shall be calculated for all fixed assets (but not for animals).

Within the PIM metod, the following data sources are used:

- Statistical data on Situation of fixed assets from the Structural Business Survey
- Administrative data collected from the accounting statements of non-financial and financial corporations, non-profit institutions serving households
- Data from general government accounts / budgetary statements
- Statistical series of gross fixed capital formation available in national accounts.
- Statistical data series on investment price indices series, by type of assets.

An exception from the permanent inventory method is the estimation method for housing stocks. This is based on „quantity x price” method using stratified statistical data regarding living floor for dwellings and their price per square meter of these dwellings.

The estimated and presented fixed assets are the following: Dwellings, Other buildings and structures, Machinery and equipment, Cultivated biological resources, Intellectual property products.

Fixed assets stocks are presented both by industry NACE Rev.2 and by institutional sectors. Thus, there are offered two perspectives on accumulation processes of the stores of value in the economy: the perspective of the various activities which produces and uses these assets, and the perspective of the sectors holding these assets.

**I. ACTIVITIES OF NATIONAL ECONOMY CLASIFICATION ACCORDING TO  
DATA TRANSMISSION PROGRAMME TO EUROSTAT**

<b>NACE Rev. 2 divisions</b>	<b>Description</b>
01-03	Agriculture, forestry and fishing
05-09	Mining and quarrying
10-12	Manufacture of food products, beverages and tobacco products
13-15	Manufacture of textiles, wearing apparel and leather products
16-18	Manufacture of wood and paper products, and printing
19	Manufacture of coke and refined petroleum products
20	Manufacture of chemicals and chemical products
21	Manufacture of basic pharmaceutical products and pharmaceutical preparations
22-23	Manufacture of rubber and plastics products, and other non-metallic mineral products
24-25	Manufacture of basic metals and fabricated metal products, except machinery and equipment
26	Manufacture of computer, electronic and optical products
27	Manufacture of electrical equipment
28	Manufacture of machinery and equipment n.e.c.
29-30	Manufacture of transport equipment
31-33	Manufacture of furniture; other manufacturing; repair and installation of machinery and equipment
35	Electricity, gas, steam and air-conditioning supply
36-39	Water supply; sewerage, waste management and remediation activities
41-43	Construction
45-47	Wholesale and retail trade, repair of motor vehicles and motorcycles
49-53	Transportation and storage
55-56	Accommodation and food service activities
58-60	Publishing, audiovisual and broadcasting activities
61	Telecommunications
62-63	Computer programming, consultancy and related activities; information service activities
64-66	Financial and insurance activities
68	Real estate activities of which: imputed rents of owner-occupied dwellings
69-71	Legal and accounting activities; activities of head offices; management consultancy activities; architecture and engineering activities; technical testing and analysis
72	Scientific research and development
73-75	Advertising and market research; other professional, scientific and technical activities; veterinary activities
77-82	Administrative and support service activities
84	Public administration and defence; compulsory social security
85	Education
86	Human health activities
87-88	Social work activities
90-93	Arts, entertainment and recreation
94-96	Other service activities
97-98	Activities of households as employers of domestic personnel and undifferentiated goods and services production of households for own use
99	Activities of extra-territorial organizations and bodies
TC	Territorial correction
CIF-FOB	CIF-FOB Correction

## **II.CLASSIFICATION OF TRANSACTIONS RELATED TO GDP**

### **2.1 TRANSACTION IN PRODUCTS**

P.1	OUTPUT OF GOODS AND SERVICES
P.2	INTERMEDIATE CONSUMPTION
P.3	FINAL CONSUMPTION EXPENDITURE
P.31	INDIVIDUAL CONSUMPTION
P.32	COLLECTIVE CONSUMPTION
P.51	GROSS FIXED CAPITAL FORMATION
P.52	CHANGES IN INVENTORIES
P.53	ACQUISITIONS LESS DISPOSALS OF VALUABLES
P.6	EXPORTS OF GOODS AND SERVICES
P.7	IMPORTS OF GOODS AND SERVICES

### **2.2 DISTRIBUTIVE TRANSACTIONS**

D.1	COMPENSATION OF EMPLOYEES
D.11	GROSS WAGES AND SALARIES
D.121	EMPLOYERS' ACTUAL SOCIAL CONTRIBUTIONS
D.122	EMPLOYERS' IMPUTED SOCIAL CONTRIBUTIONS
D.29	OTHER TAXES ON PRODUCTION
D.211	GROSS VALUE ADDED
D.212	TAXES AND DUTIES ON IMPORTS
D.214	OTHER TAXES ON PRODUCTS
D.39	OTHER SUBSIDIES ON PRODUCTION
D.319	SUBSIDIES ON PRODUCTS

## **III.CLASSIFICATION BALANCES ITEMS**

B.1g	GROSS VALUE ADDED
B.2g	GROSS OPERATING SURPLUS
B.3g	MIXED INCOME
GDP	GROSS DOMESTIC PRODUCT

## *Lexis*

*The main definitions of non-financial  
national accounts according to  
European System of Accounts  
(ESA) 2010 methodology*

## **THE MAIN DEFINITIONS OF NON-FINANCIAL NATIONAL ACCOUNTS**

**Acquisitions less disposals of valuables** valuables are non-financial goods that are not used primarily for production and consumption, do not deteriorate (physically) over time under normal conditions and are acquired and held primarily as stores of value.

**Actual final consumption** consists of the goods and services that are purchased by resident institutional units for directly meeting the human needs, whether individual, or collective.

**The adjustment for the change in pension entitlements** represents the adjustment needed to make appear in the saving of households the change in the pension entitlements on which the households have a definite claim; it comes from contributions and benefits recorded in the secondary distribution of income account.

**Adjusted disposable income** is the balancing item of redistribution of income in kind account. This account presents the households income by including the flows corresponding to the use of individual goods and services which these households receive free of charge.

**Change in inventories** is measured by the value of the entries into inventories less the value of withdrawals and the value of any recurrent losses of goods held in inventories due to physical deterioration, or accidental damage or pilfering. Inventories include all goods, other than fixed capital goods, held at a given moment in time by producer units, including: materials and supplies, work-in-progress, finished goods, goods for resale. A special typology of inventories is represented by valuables which are non-financial goods that are not used primarily for production or consumption, do not deteriorate (physically) over time under normal conditions and are acquired and held primarily as stores of value.

**Current taxes on income, wealth, a.s.o.** cover all compulsory, unrequited payments, in cash or in kind, levied periodically by general government and by the rest of the world on the income and wealth of institutional units, and some periodic taxes which are levied neither on the income, nor the wealth.

**Employers actual social contributions** consist of the payments made by employers for the benefit of their employees to insurers (social security and other employment-related social insurance schemes). Such payments cover statutory, conventional, contractual and voluntary contributions in respect of insurance against social risks or needs.

**Employers imputed social contributions** represent the counterpart to other social insurance benefits (less eventual employees' social contributions) paid directly by employers (i.e. not linked to employers' actual contributions) to their employees or former employees and other eligible persons without involving an insurance enterprise or autonomous pension fund, or without creating a special fund or segregated reserve for the purpose.

**Final consumption expenditure** consists of the expenditure incurred by resident institutional units on goods and services that are used for the direct satisfaction of individual needs or wishes or the collective needs of the community members. The final consumption expenditure could occur within economic territory or in the rest of the world.

**Final consumption expenditure of government** includes two categories of expenditures:

- the value of the goods and services produced by general government itself, other than own-account capital formation, market output and payments for non-market output;
- purchases by general government of goods and services produced by market producers that are supplied to households, without any transformation, as social transfers in kind.

**Final consumption expenditure of households** cover expenditures with purchasing of goods and services used to satisfy directly the individuals needs or the households members needs.

**Final consumption expenditure of non-profit institutions serving households (NPISH's)** includes expenditure by NPISHs on goods or services produced by market producers, that are supplied - without any transformation - to households for their consumption, as social transfers in kind.

**Financial corporations sector** includes all corporations and quasi-corporations, which are mainly involved in financial intermediation and/or auxiliary financial activities. The financial corporations sector is divided into the following subsectors:

- the central bank;
- deposit-taking corporations except central bank;
- money market funds;
- non-money market funds investment funds;
- other financial intermediaries, except insurance corporations and pension funds;
- financial auxiliaries;
- captive financial institutions and money lenders;
- insurance corporations;
- pension funds.

**Financial intermediation services indirectly measured (FISIM)** represents indirect fees applied on funds granted as loans and to deposits accepted by financial institutions. The units lending funds accept a rate of interest lower than that paid by the borrower. A 'reference rate' of interest is the rate at which both lender and borrower would be happy to strike a deal. The difference between the reference rate and the rate actually paid to depositors and charged to borrowers is a financial intermediation service charge indirectly measured. The total FISIM is the sum of the two implicit fees paid by the borrower and the lender.

**Gross balancing item of primary incomes** is the balancing item of allocation of primary income account. This concerns the resident units and institutional sectors as recipients rather than producers of primary income.

**General government sector** consists of institutional units which are other non-market producers, whose output is intended for individual and collective consumption and are financed by compulsory payments made by units belonging to other sectors, and institutional units principally engaged in the redistribution of national income and wealth.

The general government sector is divided into three sub-sectors:

1. Central government
2. Local government
3. Social security funds

General government sector includes:

- general government units which exist through a legal process to have judicial authority over other units in the economic territory, and administer and finance a group of activities, principally providing non-market goods and services, intended for the benefit of the community;
- non-profit institutions recognised as independent legal entities which are non-market producers and which are controlled by general government;
- autonomous pension funds

**Government (actual) collective final consumption** comprises government expenditure for collective consumption (general public services, defence, public order and safety, economic affairs, environmental protection, housing and community amenities, general administration, regulation, dissemination of general information and statistics, research and development a.s.o.).

**Gross disposable income** is the balancing item of the income account and measures the part of the created value at the nation's disposal intended for final consumption and gross saving.

**Gross domestic product (GDP)**, the main macroeconomic aggregate of national accounting, represents the final result of the production activity of resident producer units which meet the final demand of the economy. GDP can be compiled according to the following three approaches:

Production approach:

a)  $GDP = GVA + TP - SP$ , where:

GDP = Gross domestic product (at market prices)

GVA = Gross value added (at basic prices)

TP = Taxes on products

SP = Subsidies on products

Expenditure approach:

b)  $GDP = FC + GFCF + CS + ADV + (E - I)$ , where:

FC = Final consumption

GFCF = Gross fixed capital formation

CS = Change in inventories

ADV = Acquisitions less disposals of valuables

E = Exports of goods and services

I = Imports of goods and services

### ***National accounts 2020-2021***

---

Income approach:

c)  $GDP = C + GOS/MI + OTP - OSP + TP - SP$ , where:

C = Compensation of employees

GOS/MI = Gross operating surplus and Mixed income

OTP = Other taxes on production

OSP = Other subsidies on production

TP = Taxes on products

SP = Subsidies on products

**Gross fixed capital formation** consists of resident producers' acquisitions, less disposals of fixed assets, during a given period, plus certain additions to the value of non-produced assets realised by the productive activity of producer or institutional units. Fixed assets are produced assets used in production for more than one year.

**Gross (or net) national disposable income** equals gross (or net) national income at market prices minus current transfers (current taxes on income, wealth, social contributions, social benefits and other current transfers) payable to non-resident units, plus current transfers receivable by resident units from the rest of the world.

**Gross national income** (at market prices) equals GDP minus primary income payable by resident units to non-resident plus primary income receivable by resident units from the rest of the world.

**Gross operating surplus** is the balancing item of the generation of income account and it corresponds to the remaining value added after deducting compensation of employees and the taxes on production. In the case of unincorporated enterprises, the balancing item of generation of income account implicitly contains an element corresponding to remuneration for the work carried out by the owner or members of the family. This income, neither strictly wages nor profits alone, is referred to as 'mixed income'.

**Gross savings** represent the balancing item of the use of disposable income account and it measures the part of gross disposable income that is not intended to final consumption expenditure.

**Gross value added** is the balancing item of the production account and measures the value newly created within the production process.

**Households** is the sector that consists of individuals or groups of individuals as consumers and as entrepreneurs producing market goods and non-financial and financial services (market producers) provided that the production of goods and services is not achieved by separate entities treated as quasi-corporations.

**Households actual individual final consumption** consists of the goods and services that are acquired by households and used to satisfy the needs and wants of members of these households

('individual goods and services'). This consumption could include also government expenditure for individual consumption (medical products, appliances and equipment, outpatient services, hospital services, public health services; recreational and sporting services, cultural services; education, family and children, unemployment, housing, social exclusion) and NPISH expenditure for individual consumption.

**Households final consumption expenditure** consists of expenditures incurred by the resident households on goods and services that are used for the direct satisfaction of individual needs of the household members.

**Industry** represents the statistical unit grouping units with homogeneous production (formed by local kind of activity units). These units are characterised by unique activity falling within a single class of NACE Rev.2, by specific inputs of products and services, by production processes and outputs of homogeneous products.

**Institutional sector** all the institutional units which have a similar type of economic behaviour. Institutional units are grouped into sectors, according to the two following criteria, characteristic for their economic behaviour:

- producers class;
- the nature of activities and of their main economic function.

The resident institutional units (units whose center of interest is placed on the economic territory of a certain country) are grouped into five institutional sectors: non-financial corporations (S11); financial corporations (S12); general government (S13); households (S14); non-profit institutions serving households (S15).

**Institutional unit** is an economic entity, subdividing the economy, characterized by decision-making autonomy in the exercise of its principal function, is entitled to own goods and assets, is able to incur liabilities on its own behalf, is able to take economic decisions and engage in economic activities for which it is responsible and accountable by law. A resident unit is regarded as constituting an institutional unit if it has decision-making autonomy and either keeps a complete set of accounts or is able to compile a complete set of accounts.

**Intermediate consumption** consists of goods and services consumed as inputs by a process of production, excluding fixed assets whose consumption is recorded as consumption of fixed capital and that are either transformed or used up by the production process.

**Lending or borrowing** is the balancing item of the capital account and shows the resources that the nation puts at the disposal of the rest of world (if positive) or that it receives from the rest of the world (if negative).

**Market output** includes products disposed of on the market or intended to be disposed of on the market at prices that are economically significant.

**National accounting** represents a coherent and detailed set of accounts and tables, which offers a comparable and complete picture of the economic activity of a country. It classifies the wide variety of economic flows into a restricted number of basic categories reflecting them in a framework that allows for obtaining a representation of the economic circuit adapted to the analyses, forecasts and economic policies requirements.

The main accounts compiled within national accounting are:

- Goods and services account (0);
- Production account (I);
- Primary distribution of income account (II.1);
- Generation of income account (II.1.1);
- Allocation of primary income account (II.1.2);
- Entrepreneurial income account (II.1.2.1);
- Allocation of other primary income account (II.1.2.2);
- Secondary distribution of income account (II.2);
- Redistribution of income in kind account (II.3);
- Use of income account (II.4);
- Use of disposable income account (II.4.1);
- Use of adjusted disposable income account (II.4.2);
- Capital account (III.1);
- Change in net worth due to saving and capital transfers account (III.1.1);
- Acquisition of non-financial assets (III.1.2);
- Changes in assets (III.2);
- Other changes in volume of assets account (III.3);
- Balance sheets (IV);
- Rest of the world account (V).

**Net property income** covers the income of an enterprise which takes the form of interests, rents on land and intangible assets, rented for production purposes, dividends and other cashed income, after deducting the income of the same nature paid by the enterprise to other units (sectors, companies a.s.o.).

**Net salaries received** include the amounts received directly by the employees in return for their work (including bonuses, enhanced rates of pay, payments in kind) after deducting the social compulsory contributions of employees and tax on income.

**Non-financial corporations** consist of institutional units which are independent legal entities and market producers, and whose principal activity is the production of goods and non-financial services. The non-financial corporations sector also includes non-financial quasi-corporations. The institutional units covered are the following:

- a) private and public corporations which are market producers;
- b) cooperatives and partnerships recognized as independent legal entities which are market producers;
- c) public producers which are recognized as independent legal entities and which are market producers;
- d) non-profit institutions or associations serving non-financial corporations, which are recognized as independent legal entities and which are market producers;
- e) head offices controlling a group of corporations which are market producers, where the preponderant type of activity of the group of corporations as a whole – measured on the basis of value added – is the production of goods and non-financial services;
- f) special purpose entities whose principal activity is the provision of goods and non-financial services;
- g) private and public quasi-corporations which are market producers.

**Non-market output** represents the output produced by general government and NPISHs that is provided to other units for free, or at prices that are not economically significant.

**Non-profit institutions serving households** sector (NPISHs) consists of non-profit institutions which are separate legal entities, which serve households and which are private non-market producers. Their principal resources are voluntary contributions in cash or in kind from households in their capacity as consumers, from payments made by general government and from property income.

This institutional sector includes the following main kinds of NPISHs:

- a) trade unions, professional or learned societies, consumers associations, political parties, churches or religious societies (including those financed but not controlled by governments), and social, cultural, recreational and sports clubs; and
- b) charities, relief and aid organisations financed by voluntary transfers in cash or in kind from other institutional units.

**Output** consists of total of products created during the accounting period.

**Primary income** is the income which resident units receive by virtue of their direct participation in the production process, and the income receivable by the owner of a financial asset or a tangible non-produced asset in return for providing funds to, or putting the tangible non-produced asset at the disposal of, another institutional unit.

**Production for own final consumption** includes the goods or services that are retained either for own final consumption or for capital formation by the same institutional unit.

**Rest of the world** sector is a grouping of units without any characteristic functions and resources; it consists of non-resident units insofar as they are engaged in transactions with resident institutional units, or have other economic links with resident units. Its accounts provide an overall view of the economic relationships linking the national economy with the rest of the world.

**Social benefits other than social transfers in kind** consists of social security benefits in cash, private funded social benefits, unfounded employee social benefit, social assistance benefits in cash.

**Social security benefits in cash** include payments made for the benefits of their employees to the insurance enterprises.

**Social transfers in kind** consist of individual goods and services provided as transfers in kind to individual households by government units and NPISH's, whether purchased on the market or produced as non-market output by government units or NPISH's. They may be financed out of taxation, other government income or social security contributions, or out of donations and property income in the case of NPISH's.

**Subsidies** are current unrequited payments which general government or the institutions of the European Union make to resident producers, with the aim to influence the levels of production, the prices of products or to influence the remuneration of the factors of production.

Subsidies are classified into:

- subsidies on products (subsidies payable per unit of good or service produced or imported);
- other subsidies on production (subsidies except subsidies on products which resident producer units may receive as a consequence of engaging in production activities).

**Taxes on production and imports** consist of compulsory, unrequited payments, in cash or in kind, which are levied by general government, or by institutions of the European Union, in respect of the production and importation of goods and services, the employment of labour, the ownership or use of land, buildings or other assets used in production. Taxes on production and imports are divided into:

- taxes on products (payable per unit of a given good or service produced or transacted);
- other taxes on production (taxes paid by enterprises as a result of engaging in production, independent of the quantity or value of the goods and services produced or sold).
